The TROPICAL AGRICULTURIST

MONTHLY.

XXI. COLOMBO, JUNE 2ND, 1902. No 12.

ANNUAL REPORT OF THE CEYLON GOVERNMENT MYCOLOGIST AND ASSISTANT DIRECTOR, 1901.

FUNGAL DISEASE.

THE past year has been, from a meteorolegical point of view, ratber less favourable to the growth of fungi than is usual in Ceylon. The number of days and bours during which the atmospbere was laden with moisture has been fewer, and the dry and sunny hours more, in nearly all districts than in most previous years. In addition, a good deal of preventive aud sanitary work has been done in various districts, and this has lessened the number of spore-producing areas to some xtent.

In regard to blights and diseases of staple products of the Island, we are at least in as good a positiou, if not better, than in January, 1901. Tea diseases have not wrought much havoc, though both leaf and root diseases have still to be seriously reckoned with In cacao the stem and fruit canker are on the decrease, and will continue to be so, if cacao planters do not slacken their measures against this serious disease.

Some three hundred inquiries have been received during tbe year, chiefly dealing with diseases in tea, cacao, coconuts, cardamoms, shade and timber trees, and other estate cultivations, but a few referring to horticultural plants.

The work of diagnosing the diseases attacking specimens sent, aud by so doing being in a position to recommend preventive or curative measures, is greatly helped by an adeqnate quautity of material being submitted for examination, and also when any facts which may bear on the disease are sent with the specimens. A single leaf or too have ou occasions been received, with a request for report as to the cause of its abnormal appearance, and recommendations as to treatment, with no other information.

The task is then somewhat similar to that of a doctor called upon to examine a portion of a dead or dying man witbout any facts about the case, and asked to recommend a course of treatment for this and other similar cases. It will greatly help, in a not always simple task, if as much material can be sent as convenient; if a leaf disease, then all stages of the blighted appearance on old and young leaves, if possible uot quite dried up. For sending by post, a small tin box, such as a cigarette or tobacco box, answers the purpose well. Notes as to the time when the disease was first noticed; if tea, how long from pruning, whether on all the plants or only some, whether on all leaves or only some; the conditions present, favourable or otherwise, such as drought, cold, or excess of rain—all these are of much value in forming an opinion as to the causes of disease.

ENVIRONMENTAL DISEASES.

Many of the specimens sent for report are found on microscopic examination to coutain no parasitc fungi or other organisms, and to be affected by what are purely *environmental* diseases, *i. e.*, due to the presence of physical conditions. such as drought, excess of water, absence of nutritiou in the soil, powerful and continuous wind, lightning, and other such causes. In these cases, when the tissues have been found to be free from the presence of any parasitic organism and show no signs of having been attacked by any insect or otber animal, an investigation of the oonditious under which tbe plant has been living is needful, in order to find out the why and wherefore of the evil.

Two cases of tea struck by lightning were examined, and from the facts observed by the planters sending them, and the appearance under the microscope of both stem and leaves, there was no doubt that the injury was due to the passage of an electric current along the ground occupied by the roots of the plants. I have investigated a similar case in England, of elms in Leicestershire struck by lightning, where the shrubs and other plants near the elm trees were damaged along the track of the current.

In the Ceylon case a Grevillea tree was struck and the tea bushes immediately surrounding were damaged. In such cases of accdental injury it is possible by the help of some cattle or other suitable manure to prevent the plants dying, if they are observed and treated soon after the shock.

It is often not easy to say definitely that the lack of health of a plant is due to environmental causes, especially without careful observations of the circumstances of the case, but these are evils that the planter knows well and knows the way to cure—by removing the conditions. In my experience the planter generally does recognize environmental diseases, though, as is only to be expected, he is inclined to attribute the first effects of certain root diseases which are caused by fungi to such causes. If, however, bushes in nearly similar conditions, and apparently originally as vigorous, are "shuck," some root disease of a fungal nature may legitimately be suspected. In any case of doubt the roots should be examined, and if a fungus is found, or if signs of it are seen, such as discolouration and decay of the root tissues, the whole should be destroyed by burning, and the soil around limed.

The planter who will suffer least from diseases in his cultivations must exercise the same observation and use the same care to keep his plants in health as he does for his horse or his dog. Without a knowledge of the anatomy and physiology of animals, he is yet able to prevent and cure many of the diesases of his domestic animals, and so in the case of his plants; whatever kind they are he may use preventive and curative means as soon as he notices any disease affecting his estate.

LEAF DISEASES OF TEA.

Tea has been throughout the year less affected than last year by leaf diseases. In the case of Gray Blight (*Pestalozzia Guepini,*) it has been sent to me from almost every tea district in the Island, and therefore seems to have spread across wide areas. Though I have since my arrival in the Island examined an immense number of diseased leaves from jungle and other plants said to be affected by this leaf disease, I have in no case found the fungus to be growing on any other plant. In many cases badly affected tea is surrounded on one or more sides by jungle or scrub and though vast numbers of spores must have lit upon the leaves of plants growing there, no blighted leaves with this particular fungus have been found.

An interesting case of the method of distribution of spores was observed on an estate in a wet district. On the windward side of a narrow strip of jungle, at the brow of a hill, was a badly blighted field of tea; a road some 20 or 30 feet wide had been cut through the jungle, and on the leeward side was a field of tea, only blighted on the bushes which were opposite the opening through the wood. This points to the protection of tea in some cases by means of wind or other belts of trees The whole question of spore distribution is one of rather a complex nature; it is however one of great importance from an economic point of view, and the experiments initiated during the year with a view of gaining a definite knowledge of conditions under which spores are distributed will, it is to be hoped, lead to measures likely to prevent or hinder the spreading of the spores of leaf diseases.

SPORE DISTRIBUTION EXPERIMENTS.

The experimental "tabernacles," which are built of jute hessian and are 45 feet long by 8 feet broad, enclosing thirty tea bushes in two rows of fifteen, are 9 feet high, and are placed at right angles to the prevailing winds in certain selected districts at various elevations and climates. They are open to the sky, and the tea in the enclosure is as nearly as possible under the same conditions as that outside. The observations already made in the tabernacle where the tea has already begun to bear leaves have yielded valuable information, and when the whole of these enclosures at varying heights and climates are under observation many data of importance will be gained.

All the tea both in the tabernacle and the surrounding field is pruned and when the field has come into bearing all leaves on bushes inside the enclosure and around it which show any sign of disease are examined microscopically and the disease determined. The outbreak of disease on either side of the tabernacle is also observed and recorded in the same way. By thus observing at close and regular intervals the same thirty bushes a knowledge is gained of the behaviour of different bushes to disease. One question of much interest as regards tea with gray Blight and other leaf diseases, viz., whether the weakly bushes are more or less liable to attack than more vigorous plants, and as to how they re-act to the disease, can here be studied carefully. The data are to be collected at the different stations by the superintendents of the estates selected and the leaves forwarded to me for examination. I also hope to personally inspect them at certain intervals. These gentlemen have most kindly taken a great interest in the investigation, and their valuable help in this matter will, I hope, be repaid by an advance in our knowledge of the whole question. The following is the schedule to be returned after each plucking, which will explain to those interested the *modus operandi* of the investigation:—

TEA BLIGHT INVESTIGATION.

The Mycologist, while wishing to reduce the amount of trouble taken by each observer, will be glad to receive as complete answer as possible. If the terms suggested in the footnotes only are used the comparison of the observations at the different stations will be simplified. When convenient the returns should be sent to Peradeniya next day, so that the diseased leaves can be examined with little delay. All the diseased leaves should be sent, unless too bulky, when they should be weighed and the weight sent, with as many of the leaves as possible.

The tabernacle should be kept closed and only the Kangany or Cooly who is to pluck the bushes admitted.

Name of Estate———

Date of plucking———

Weather Conditions * —— ——

Wind † ———

Weight of leaf plucked from enclosed bushes (green) } ———

Approximate number of bushes from when the diseased leaves came } ———

Condition of nearest bushes on North side of tabernacle } ———

Condition of nearest bushes on South side of tabernacle } ———

Does the flush on enclosed bushes fairly agree with the rest of the field? } ———

Remarks or observations:—

* "Very wet," "rainy," "no rain," "no sun," "sunny," "hot sun."

† "No wind," "little wind," "variable," "constant wind," "strong wind."

GRAY BLIGHT ON YOUNG SHOOTS.

As was mentioned in my last annual report, a circumstance with regard to Gray Blight, which calls for attention, has been again more than once brought to my notice. It is the fact that the fungus grows in some leaves so vigorously that it penetrates back through the leaf-stalk to the young shoot. In these cases it is able to grow longer than it can do in the leaf, which usually falls off the bush when entirely killed by the fungus and consequently it is on these older parts that I have at last discovered the perfect

fruiting form of the fungus or ascigerous state. This form I am investigating, and it will form the subject of a paper of a more technical character than is suitable in these Circulars. From a planting point of view this discovery is most interesting, as it points to one method this fungus has of perpetuating itself. All such cases, which can be seen by the discolouration of the young shoots and the absence on them of any flush, should be treated by pruning these young shoots back and burning the prunings. A case has occurred of the Gray Blight fungus attacking the youngest beds over a whole field and reducing the yield to a grievous extent. I cannot say whether in the cases I have examined the buds were "banji" by which I mean buds the growth of which has been checked, or whether they were attacked when in their earliest stages.

If the buds are "banji" they may have been on the bush for sometime—long enough for the growth of the fungus as it generally occurs; and further it is probable that the presence of the fungus in the buds may itself have produced a "banji." This phase of the Gray Blight fungus is, however, still being investigated and I may hope to learn more of its nature on visiting the area affected and noticing the conditions prevalent there.

The efforts of the Gray Blight fungus in this direction to decrease the output of tea should be carefully watched and by pruning lightly below the infected places, stopped before it becomes at all common.

ROOT DISEASE OF TEA.

A Disease which is more difficult to fight, and which has more disastrous effects in the places where it occurs, is the root disease of tea, which is to be found in many districts, more especially those at higher elevations, where the disintegration of dead vegetable matter is slower than in the low-country.

This is caused by a fungus, most probably *Rosellinia radiciperda*, Massee though in almost all cases there are not present the fruiting parts of the fungus, by which alone it can be certainly identified.

The mycelium of the fungus commonly called "White Root-rot," can be noticed as white thread-like strands, easily seen with the naked eye. When it has permeated the root entirely, it often assumes a fan-like shape covering the surface of the root, and can be easily detected on scraping away the dirt and the outer surface of the root. The majority of known fungi are saprophytic, *i e.*, living on dead and decaying substances; others are parasitic, *i.e.*, growing on the living tissues of plants or animals. In some cases fungi have the power to exist in both these ways, and the tea root disease fungus is one of this latter kind. It begins its life as a saprophyte on any dead timber of a suitable kind. The softer and more spongy roots of trees like Symplocos, when the tree is cut down, are an ideal home for this fungus

I have found it growing on various jungle roots,—in most cases it is not easy when the tree has been cut down for sometime to certainly determine the species of the root,—on buried logs, and prunings of all sizes, even no thicker than a slate pencil.

Having grown for some time on these dead hosts, when moisture is present it spreads out in different directions until it encounters another piece of suitable food. Unfortunately for the cultivation of tea it has acquired the liking for the living roots of tea bushes. The mycelium can grow to a considerable distance through the soil if damp until it reaches the next piece of nutritive material. I have observed a strand of mycelium 8¼ inches in length which had apparently no intermediate host in its growth from a piece of dead Symplocos root to a young root of tea. It must be borne in mind that the presence of moisture is necessary for the growth of this fungus, and also that when it first reaches and attacks the root of living tea the injurious effect to the plant is not noticeable.

From a large series of observations I believe that in the case of vigorous tea a bush may be affected for two years or longer without succumbing. The tea bush is a hardy plant and makes a good fight against such an enemy, but it is hardly possible that if once the fungus has got a foothold on its roots it can ever throw it off. I have seen this fungus killing out gradually some of the finest tea bushes in a field, and it will generally be seen that when one bush is badly affected and almost dead, some of the surrounding bushes are unhealthy and show signs of suffering, though in a less degree, from the same evil.

The remedies which should be employed to prevent spread of this disease are simple, and where carried out thoroughly have in all cases lessened and should eventually drive out the fungus.

The cutting of drains not less than two feet deep by one broad has the double effect of removing moisture from the soil and isolating the patches of disease, as the fungus mycelium cannot pass over a space of one foot, and if these are kept free from decaying matter, it will be stopped in its progress.

The burying of prunings in infected areas is dangerous and should be discontinued, as by this means the fungus has no other food than the roots of the tea and may be starved out.

The use of lime is undoubtedly a deterrent to the progress of the fungus, but since it is not possible to effect the application of lime so that it is in contact everywhere with the mycelium of the fungus, it is not always successful. I have been told by a careful observer that he has noticed a piece of lime round which the strands of this fungus were wrapped, and I am at present experimenting on the action of various proportions of lime in cultures of this mycelium.

All bushes which are killed should be carefully dug out, leaving none of the root if possible. The hole should be exposed to the air if the weather is fairly dry, and before filling in an application of lime should be made.

The ditches or drains should be dug around a larger area than is observed to be diseased, as some of the surrounding bushes may have the fungus in their roots though not noticeably diseased.

It may be noted as an encouraging feature in the case of this fungus that it rarely produces its spores underground, and seldom reaches the surface, and therefore almost its sole means of spreading itself is by the running through the soil of its mycelium or vegetative portion.

CACAO CANKER AND OTHER DISEASE.

Passing from tea to other cultivated plants, a leaf disease of the coconut palm has been studied, which bears a close resemblance to Gray Blight in tea, though it is undoubtedly distinct, and does, happily, not do very much damage to this valuable products.

The canker of cocoa has been somewhat fully dealt with in a Circular discussing the whole question, and it may be mentioned here only briefly. No new phases in the workings of this disease have been found, and the cures and prevention where used have continued to repay those carefully carrying them out. It is still a subject for regret that larger areas are untreated, and that in these places the fungus prospers and spreads both on pod and tree.

It may be that this report will reach some cacao planters who may not have read the circular "Cacao Canker in Ceylon," published in October last, and for these it will be well to repeat the summary of measures which are, I think, very generally considered as effective:—

"*Prevention.*—Regulate the shade so that the sun and air can reach all parts of the cacao trees, and keep the cacao from being so close as by its own leaves to densely shade the ground.

"Prevent dampness by surface draining, especially in low hollows.

"Allow suckers to grow on all trees that show any sign of disease.

"Burn all dead cacao trees and branches.

"Burn all discoloured pod husks from whatever cause they are discoloured. If this is not possible bury with lime.'

"Bury all pods under at least two inches of soil with a sprinkling of lime.

"*Cure.*—Cut out all diseased patches on bark or branches, removing also a wide margin—not less than two inches—of apparently healthy bark, and burn all the pieces removed.

"If this method is too expensive or too drastic, shave lightly over the diseased areas and around them, and burn the shavings. This latter treatment is not so effective as cutting out. Such work should be done vigorously in the dry weather, when the results are vastly better.

"Keep a gang of expert coolies continually on the look out for new canker patches, and have these parts removed before they spread far or produce their spores.

"Notice any dead cacao trees or branches on neighbouring small holdings, and endeavour to get these removed and burnt.

"These sanitary measures should be carried out on all estates, even where the canker is very rare, and the personal oversight of the superintendent seems to be the only way to prevent small patches of disease being missed in going round. It is much better to take a longer time in going round the estate and have the work thoroughly done than to cover large areas and overlook some canker."

Another disease of cacao of which the nature is not yet exactly known, has been observed and investigated. This is a condition of small and unripe fruits, which is characterized by the unusal flexibility of the pods, giving them when handled the feeling as if made of indiarubber. Pods when in this condition are said to never attain full maturity, and, as a rule wither up and are of no use. I have not been able to find in any typical pods of this character any mycelium of a fungus or injury by insect and it is probable that this is another of the environmental diseases, the cause or causes of which are not yet apparent. That the fruits are fertilized seems proved, an examination of many showing a normal embryo. The loss by this "going off" of a proportion of the pods is important. This condition must not be confused with the drying up of very small pods, which is referred to later, and which at present seems to be due to different causes.

GREVILLEA DISEASE.

A disease of *Grevillea robusta* very prevalent in certain districts is at present occupying my attention. This is a canker which, though it grows upon the roots of the Grevillea tree as well as the stem, seems in most cases to originate on the stem, usually near the base. The external signs are a darkening of the bark accompanied, as a rule, with an exudation of gum at various points. Some trees are being treated experimentally, and the fungus is being cultivated, and its effect on the tree examined, some healthy trees being inoculated for this purpose. A Circular will be issued and preventive measures recommended when the facts desired are obtained.

Meanwhile it is important that a look out should be kept for this disease of a most valuable shade and timber tree. All specimens which seem to agree with this short description should be noted, and I will be glad to be informed of their existence and any facts bearing on the case.

FINGER AND TOE DISEASE OF CABBAGES, &C.

Passing from diseases of our extensively grown plants to those of others, the most important is *Plasmodiophora Brassicæ*, Wor., which has been found in more than one place on cabbages and turnips; it is due to a fungus which attacks the roots and shows itself in malformation of the root, lack of vigour, and subsequently in the death of the whole plant. This disease has been known in Europe for more than a hundred years, and in England is called "Finger and toe," "Club-root, Clubbing," and "Anbury." On the Continent the popular names also have reference to the shape of the root, which resembles fingers and toes. Thes malformations are due to the irritation or stimulus of a fungus which belongs to the group of Myxomycetes, or "Slime fungi," a most interesting group botanically but not so important economically, since hardly any of them are parasitic, *i.e.*, disease-producing, or other plants. This slime fungus is so called because it has no outward shape, like the majority of the fungi, but consists of a mass of plasmodium or jelly-like material which makes its way from cell to cell of the root and absorbs the contents of each.

After consuming all the food it can find it forms its spores—which are the reproductive bodies and may be considered as seeds—and these can remain for some time without sprouting. In Europe they carry the fungus over the winter and germinate in the spring. When conditions are favourable, these resting spores germinate and throw out a jelly-like material, which it comes in contact with the young root of a cabbage, turnip, or similar plant penetrates into it and produce the "finger-and-toe" disease.

There are two recognized methods of fighting this disease. The first is to starve out the fungus, and this is done by taking advantage of the fact that *Plasmodiophora Brassicæ* only grows on cruciferous plants, *i.e.*, plants of the cabbage order. By not growing such plants as cabbage, kale, turnip, kohl-rabi, and substituting crops of potato, lettuce, beans, peas, *&c.*, the fungus can obtain no food, and will consequently in a few years be entirely exterminated. The other one known is lime, and this is only a partial remedy. It has been found that acids favour the development of the "finger-and-toe" fungus and alkalis retard it. Thus, a dressing of lime in a garden or field affected by this disease is of value, though not a certain preventive. It is to be hoped that these measures, preferably the former, may be taken wherever this evil is present in Ceylon, so that this disease may not get a foothold in this Island, such as it has in Europe, where it annually causes great losses to root crops and other plants.

FUNGI CAUSING ROTTING OF TIMBER.

Two other fungi have been studied both of economic interest, though not growing on living plants. The first is a species of Polyporeæ growing upon beams used for building purposes and causing "dry-rot,' the name of which until the cultures have grown sufficiently to produce fruit cannot be given. Some experiments are being made with substances suited to preserve wood from the attacks of this fungus, and also with some different woods in use for building in Ceylon, as to their liability to attack. Some woods are by their structure less easily attacked by this fungus and it is well that the exact amount of immunity they possess should be known.

FUNGUS ON RUBBER.

Another is a fungus which grows upon samples of rubber, those examined begin from *Hevea Brasiliensis*, Para rubber; it was growing more abundantly upon those samples which had been precipitated with acetic acid, than on the untreated rubber, but this point will be experimented on. The fungus is a species of Syncephalis, and causes characteristic red markings in the sample, though not destroying its translucency. Whether the growth of this fungus on the rubber affects the market price, I have yet to learn.

OTHER DISEASES OF PLANTS.

The following plants, in addition to those previously mentioned, have been received as diseased; where the fungus causing the disease or growing on the plant has been identified it is mentioned. In other cases the material did not afford means of identification:—

Dillenia retusa, *Thumb.* Marasmius sarmentosus, *Fr.*
Michelia Champaca, *L.* (Sapu). Polyporus sanguineus, *Fr.*
Garcinia Xanthochymus *Hk. f.* (Cochin Goraka.) Strigula Complanata, *Fee.*
Oxalis corniculata, *L.*
Mangifera indica, *L.* (Mango). Fusicladium, *sp.*
Crotolaria, *sp.*
Desmodium cajanæfolium, *DC.* Peronospora, *sp.*
Phaseolus vulgaris, *L.*

Erythrina umbrosa, *H.B.K.* (Bois immoretelle) Sparassus, *sp.*
Acacia decurrens, *Willd.*
Rosa indica, *L.* Phragmidium devastatrix, *Sor.*
Eucalyptus, *sp.* (Gum tree). Rosellinia radiciperda, *Mass.*
Quisqualis indica, *L.* Corticium, *sp.*
Passiflora cœrulea, *L.* (Passion-flower). Cystopus, *sp.*
Cucumis sativus, *L.* Cucumber. Peronospora, *sp.*
Daucus Carota, *L.* Carrot.
Coffea liberica *L.* Cladosporium herbarum, *Pers.*
Rhododendron sinensis, *Sw.*
Mimusops hexandra, *Roxb.*
Piper nigrum (Black pepper). Coleroa, *sp.*
Acalypha indica, *L.*
Agathis obtusa, *Lindl.* Strigula complanata, *Fee*
Musa paradisiaca, *L.* (Plantain).
Karatas *sp.* Pythium de Baryanum, *Hesse.*
Elettaria Cardamomum, *Maton.* (Cardamom).
Areca Catechu, *L.* (Arecanut palm). Physcia speciosa, *Fr.*
Corypha umbraculifera *L.* (Talipot palm). Sphaeria, *sp.*
Borassus flabelliformis, *L.* (Palmyra palm) Sphaeria *sp.*
Caladium biscolor, *Vent.* Diachoea elegans, *Fr.*
Panicum sanguinale, *L.* Ustilago, *sp.*
Setaria glauca *Beauv* Claviceps, *sp.*
Andropogon, *sp.* Epichloe typhina, *Tul.*
Eleusine aegyptiaca, *Pers.* Ustilago *sp.*
Adiantum Capillus-Veneris, *L.* (Maiden-hair-fern Cystopus, *sp.*

Some other plants and parts of plants were received which the senders did not know the name of, and which did not afford sufficient material for naming.

"BLUESTONE" AS A WEED KILLER.

Other botanical matters not relating to fungi or plant diseases have occupied my attention during the past year. The question of the use of "Bluestone," Copper Sulphate, in stopping the growth of weeds like oxalis, has been investigated, but the experiments showed little or no effect. The undoubted value of this substance in getting rid of charlock from wheat fields in England, without damaging the crop, suggested this experiment, which will be continued under different conditions until it can be definitely stated that it has no useful effect, or its value proved.

GRASS SEEDS FOR PASTURES AND LAWNS.

An examination of the seed used in laying down a large area of grass at a high elevation has been made. Four different samples of the mixture, which was obtained from a leading English seed merchant, were analyzed and the proportions of each of the different grass and clover seeds in the mixture determined. By enclosing a portion of this land and allowing the plants to flower, which has been sown down for some time, and observing the plants forming the herbage, an interesting record will be obtained as to the grasses and clovers which have grown and prospered, and those that have failed to come up at all. In this way we shall arrive at a conclusion as to what European grasses, clovers, and other herbage and lawn plants are suited to the hill country. I shall be glad to receive samples from any one who is laying down European seeds, to analyze and give advice as to the value of seeds for the purpose. The practice of buying mixtures is, however, to be deprecated :it is much better to get from the seedsman the required quantities of named seeds and mix them when bought.

CACAO CUTTINGS.

Cacao and its improvement has not been lost sight of. In the first place, though my own experiments in obtaining new plants from cuttings have not proved successful either in the open or under glass, Mr. Herbert Wright, the Scientific Assistant and Acting Curator of the Gardens, has achieved the required result, and has succeeded in rearing a plant from a cutting. The conditions which seem to have helped in this case are a sandy soil and an abundant and constant supply of water at the roots. It will be well if this is noted by cacao planters, so that they may be helped in their experiments in this direction. It need hardly be stated how valuable it will be if we can arrive at an easy method of striking cacao cuttings, as by this means we can perpetuate the characters of a specially valuable tree.

MEASUREMENTS OF CACAO PODS.

The measurements of fruits have been continued with a view to arriving at a decision as to whether any external characters of the pod can be used for selection of seed. The same results which were recorded last year, and later in a short note in "Tropical Agriculturist" for April, 1901, have been arrived at, viz, that the external shape and size of the fruit affords no criterion as to the commercial value of the seed within, and may often be a most misleading character. The pods examined—more than 1,000 in all—were of all kinds and varieties and on different estates. They were all measured accurately, both lengthways and around the thickest part, and weighed; then they were opened and the number and weight of the seeds and the weight of the fruit wall recorded. The diagrams, produced first in the *Tropical Agriculturist* show more clearly than any explanation the absence of relation between external characters of the fruit and weight of seed.

SELECTION OF SEED IN CACAO PLANTING

The natural method of selection of seed pods with our present knowledge of cacao is to select from a parent possessing the qualities wanted. A heavy cropper, *i.e.*, a habitual heavy cropper, not an occasional big yield, a hardy plant, these are the things to be looked for in selection, if we are to improve our Ceylon cacao. No fruit tree gives better promise, and the wonders which have been achieved in improvement of the European and American fruits are an example to encourage in this direction. An experimental plot which was mentioned in last year's report, in which were planted seeds from a tree which has borne for six years an average of 434 ripe pods, has been preserved and tended, and the plants from this bed will be planted out and carefully watched with a view to their possessing a great deal or in part this heavy cropping character of the parent tree.

POLLINATION OF CACAO.

The pollination of cacao has been again worked at, though unfortunately pressure of other matters prevented much time being devoted to this interesting question. That the heavy cropping qualities of some of our Ceylon trees is due to the more effective pollination and fertilization is more than probable, and therefore a knowledge as to the method of pollination will perhaps help us in finding what conditions are most favourable to the setting of a large quantity of pods. So far as my researches in this field go, I have only discovered one animal, an aphis (*Aphides Ceylonica Theacola*, Buckton,) which was carrying pollen grains. This insect I found in considerable numbers in buds and young flowers, and several of them had pollen grains of the cacao adhering to their bodies and limbs. During the next flowering season I hope to carry out an exhaustive series of experiments with regard to the pollination of cacao. Some remarks on this matter in my last annual report were misunderstood, and in letters to the daily papers it was thought that I was attempting some method of artificial pollination. The structure of the cacao flower and other things render this impracticable. In this connection it may be mentioned that inquiries are still made to me about the structure of the cacao flower, owing to an erroneous statement as to "male and female" flowers being at one time published. The flowers of cacao are all truly hermaphrodite, *i.e.*, having both stamen (male) and pistil (female). I have in an examination

of a very large number of flowers, while working at the fertilization, never found any abortion of organs.

Cacao seed has been sent to distant parts of the British Empire with a view to discovering the length of time that the seed will retain its vitality under varying conditions. It is important to know the best method of sending seeds or young plants from a distance.

TOURS AND PLANTERS' ASSOCIATION MEETINGS.

During the year I have visited many plating districts, including Badulla, Passara, Monaragala, Dikoya, Matale, Deltota, Dumbara, Ambagamuwa, and the low-country, where experiments and investigations have been made and material collected for laboratory work. I have also attended Planters' Association meetings at various centres, where diseases of plants and cognate matters have been discussed and explanations given on various technical points. It is a pleasure to record my thanks to many planters for valuable help in investigation of plant diseases and other matters.

J. B. CARRUTHERS,
Government Mycologist and
Assistant Director of the Royal Botanic Gardens.
Peradeniya, January, 1902.

PINEAPPLES, ORANGES, CASSAVA, MANGOES, &c.

REPORT ON THE CULTIVATION OF

PINEAPPLES AND OTHER PRODUCTS OF FLORIDA.

By ROBERT THOMSON.

(Formerly Superintendent of the Botanic Gardens of the Government of Jamaica, now Adviser to Messrs. Elder Dempster & Co. on the cultivation of Fruit and other products.)

(Concluded.)

ORANGES.

I visited according to arrangements made at Washington a great Orange nursery at Glen. St Mary, about 30 miles from Jacksonville. Many millions of plants have been propagated here. There are here about half a million plants comprising all the best varieties of Citrus fruits. The proprietor is a well known expert. Orange cultivation prior to the great freeze of 1895, was the greatest industry of Florida, it was the chief "wealth producer" extending over an immense area to the south of Jacksonville. Previous to that great disaster that ruined thousands of families, this region was extolled as the most congenial in Florida for Oranges, for it is recognised by most leading growers that the further north even to "danger point" they grow the more luscious is the fruit. The tallies with our cultivation on the hills. Another frost 2 years ago destroyed the groves connected with this nursery, the trees being frozen to the ground. Thousands of groves were also destroyed by that morning's frost over hundreds of miles of land. Many of the growers are now planting further south in order to escape the frosts. Since last frozen the trees have sprung anew from the bases of the trunks and they now present a splendid appearance having attained a height of seven or eight feet. Several stems are allowed to grow from the base,—most luxuriant stems, branches and foliage. Next year innumerable trees are expected to yield considerable crops. Only a few severe freezes have occurred in about 60 years.

In this extensive nursery thousands of small plants budded two years ago yield from 20 to 40 fruits each. I suggested that many hundreds of small trees could be grown to the acre for early cropping. These precocious trees are budded on citrus trifoliate stock. Pears, peaches and plums are commonly cultivated side by side with the orange. Many of the groves in the great orange region of Orlando that were less severely injured by frost are now in a flourishing condition, far finer trees than any in Jamaica. This is another example of the capability of a sandy soil, in which they are made to flourish by constant care and fertilizers At this nursery I witnessed a new departure in orange cultivation. A considerable number of plants are under experimental treatment for the Department of Agriculture at Washington, plants that were hybridized a few years ago. There are at least 50 very distinct forms, distinguishable by foliage, etc. These are about 8 feet high, and some of them are likely to fruit next year for the first time. At Miami a few hundred miles further south I also saw duplicates of these new forms at the Government Experiment Station, but much smaller plants. Varieties that will endure more frost as well as superior in point of quality are anticipated from these hybridized types. In the orange plantation connected with this nursery my attention was directed to great piles of logs between some of the wide rows of trees. I was surprised to learn that these piles are placed in summer in readiness for the winter frost. When the temperature falls seriously the huge piles of wood are set on fire to repel the frost by means of smoke, this in the open air. The result is usually satisfactory. Orange groves I noted everywhere are peculiarly sensitive to bad cultivation, that is by allowing weeds to grow, by witholding fertilizers, by insufficient cultivation. Whenever neglected, they languish. The ownership of a ten acre grove has been and is still looked forward to as ample to provide all the comforts of a well-to-do family. Each tree is highly prized, for on arriving at maturity it is valued at from $15 to $25. "In an Orange Grove 8 to 10 years old $1,000 per acre has often been realized." Ordinary manure is deprecated "the benefits of barn manure in an average grove are in serious question. The fruits produced by nitrogen from this source are as above stated usually large, coarse, thick skinned, with abundant rag and of inferior flavour," My attention was repeatedly called to the notorious manner in which oranges are packed in Jamaica. Frequently trained packers have been selected in Orlando, sent a few days journey to New York or Baltimore at great expense and besides paid $2 a day to rehandle orange shipments from Jamaica, that is to size, pick and repack in boxes for distribution. Orange growers and dealers freely express their surprise at this incredible example of Jamaican incompetency. For be it remembered that the splendid quality of the fruit itself is depreciated. "Fruit which is well known by a brand will often sell readily and quickly for 50 per cent more than other fruit equally as good, but not known to be so by the buyer." Orange and Grape Fruit groves are being largely planted in the vicinity of Miami. Plants three years old budded on small lemon stock yield 100 fruit. The size and luxuriance of the foliage is remarkable. Several of the most successful growers informed me that they did not know 10 years ago the difference between an oak and an orange tree. With determined energy and enthusiasm they have become noted cultivators. Before the 1895 freeze five million crates of oranges were shipped from Florida valued at about fifteen millions dollars. After this freeze the number of crates fell to 100,000. Last year it increased to 750,000 and next season double the latter number are expected. California produces six million crates. In a conservatory at Washington the most famous of all orange trees was pointed out to me, the original plant of the navel variety from which by propagation about half of the orange crop of California has originated. Californians commonly salute this wonderful tree.

Since my return from Florida I have visited the parish of Manchester the chief centre of orange production in Jamaica, more than half of all that are shipped coming from here. One firm alone collects

and ships about 100,000 barrels a year. Great benefit has accrued to Jamaica by the naturalization of plants introduced hundreds of years ago, Thus Logwood and Oranges have spontaneously overrun hundreds of miles of the Island and the former has long been established as one of the staple products. The spontaneous diffusion of a species of plant affords abundant proof of the eligibility of the environments in which it grows. Innumerable orange trees are thus widely diseminated in Manchester. Intermingled with other forest trees they have been subjected to severe condition of existence. Thus they present a dwarf stunted aspect. Practically the only attempt at cultivation has been to destroy the native trees by which they are surrounded with the result that small crops are obtainable. From these semi-wild trees thus reclaimed from the forest the average yield is less than half a-barrel each. A little attention is sometimes bestowed upon groups of trees. For instance, trees occur on the settlers' coffee fields which have to be regularly weeded. Here they occasionally yield several barrels each and they present a distinctly improved appearance. One of the settlers pointed out a considerable group of trees he obtained on land he purchased. A few years ago his first crop was sold for 3s, the following year he had 6 barrels and in the two subsequent years 14 and 62 barrels respectively. The trees are very unequally distributed; in many places from 20 to 60 may be counted on an acre—occupying but a small portion thereof. Commonly from 6 to 12 of these dwarf trees are crowded in a space equal to that allotted to a single tree in Florida. The Manchester oranges are excellent in point in quality. They are sold at 2s. per barrel of about 400 fruits. If they were carefully handled, sized, etc., and packed in boxes the value would be greatly enhanced. It is interesting to note that several gentlemen in this parish are initiating the cultivation of budded trees with very promising results. I strongly recommend medium sized wild trees as the best stock for budding purposes. This can be done on a large scale. The cultivation of Coffee in Manchester is a large industry among the small settlers. The profit realizable can hardly exceed £2 per acre. If the same cultural attention were paid to the cultivation of oranges the returns would be surprising. Instead of an acre, containing irregular groups of desolate orange trees aggregating some 30 to 60, from which 20 barrels may be obtained, 150 of these small trees could be established per acre by the simple process of transplantation. By higher cultivation than that applied to Coffee 300 barrels of oranges would be assured per acre. On the lines I have propounded orange cultivation is capable of becoming one of the great industries of the Island. There are numerous decayed or worn out trees that should be destroyed and replaced by healthy medium-sized trees. Better to cut the transplanted trees well back to induce new and vigorous growth. In the delightful climate of the Port Royal Mountains this tree yields the very best possible fruit. Thousands of acres could be cultivated in lieu of thousands of trees as at present. The moderate application of fertilizers would ensure splended returns when the soil is not sufficiently rich, this applies to all parts of the Island. All the conditions referred to emphasize our pre-eminent orange growing capabilities, capabilities such as throw into the shade all Florida that culminated with returns valued at 15 million dollars. Our illimitable resourcesawait enterprising Englishmen to embark in orange growing. Limes grow with perfect success, double the size of those that grow on the keys of Florida. On rocky land hundreds of thousands of lime trees could be established at a trifling cost.

CASSAVA CULTIVATION.

It is an interesting fact that Orlando (in Florida) the home of the pineapple shed system of cultivation, is indebted to Jamaica for an important industry. About three years ago an American tourist in Jamaica, Mr. Perkins, was struck with the value of cassava as a starch-yielding plant. On his return to Florida he organized a company and erected a great factory at Lake Mary, 18 miles from Orlando, for the manufacture of cassava starch. I visited the factory at the end of June and was kindly permitted to see through it, the managers taking a great interest in Jamaica. One thousand acres of cassava are cultivated in the vicinity hundreds of acres of which by gentlemen connected with the factory. There are fields of one hundred acres each which I had the pleasure of inspecting. Within 60 miles of the factory the managers purchase the tubers delivered at railway stations at $5 per ton, and the culture is extending rapidly. This factory crushes 40 to 50 tons of tubers daily during the cropping season of 4 months. The average crop per acre is 9 tons. This plant grows remarkably well on the all present sandy soil. On the day of my visit to a 100 acres field fertlizers were applied to the field, to the value of $500. I pointed out that larger returns would be obtained from a better soil, in fact double the crop. The yield of starch from the tuber is from 17 to 20 per cent. It is also noteworthy that the manufacture of tapioca and dextrine from cassava are to be taken up with the least possible delay. The coloured labourers employed in this cultivation are paid $1 a day. From the planting to harvest seven months are requisite. On account of the winter frosts the seed (stem cuttings) has to be buried in the sand for several months, Great piles of them are thus covered during the winter. The cost of preparing the land for this cultivation is $40 per acre. This for digging up the Palmetto roots which cover the land. I quote the following from a Savannah Newspaper of June, 29th, 1901, relative to this cassava factory: " Brunswick's Board of Trade held an interesting meeting to-day to hear an informal address from President Perkins of the Florida Starch Factory, and for a lengthy session President Perkins entertained a large attendance. President Perkins is en route to the North, where he will study the needs of various cotton factories in their use of starch, and will still further adapt his factory to the manufacture of products suited to them. At present his firm has about $100,000 invested in the development of the cassava industry and the enlargement of their plant is one of the near by plans." During my sojourn in Florida, I collected other valuable information regarding cassava as an article of food for cattle, etc. Indeed Florida is determined to make cassava a leading staple product. The matter is discussed everywhere. From the report of the professor at the Florida Agricultural Experimental Station I make the following extracts " With all the facts procurable, and with the experience not only of myself, but many practical farmers to support the opinion, I have reached the conclusion that, all things considered, cassava comes nearer furnishing the Florida farmer with a more universally profitable crop than any other which he can grow on equally large areas. It can be utilized in more ways, can be sold in more different forms, can be more chiefly converted into staple and finished products and can be produced for a smaller part of its selling price than any other crop. It is unquestionably true that cassava, all things considered, comes nearer supplying a perfect ration for farm stock than any other concentrated food produced upon Florida farms. Every beef animal in Florida can be put in the condition of western stall-fed cattle by the simple use of cassava at a mere fraction of the cost to the corn feeders of the west. An acre yielding 40 bushels of corn would at this rate produce 1,187 pounds of starch, while an acre of cassava producing 6 tons would yield 2 400 pounds of starch. It thus appears that cassava is to-day the cheapest known source of starch, costing at present market values of raw material only about one fourth as much as its nearest competitor. Not only therefore does the high yield of starch in cassava place it prominently before manufacturers as a probable new material for the great glucose industry, at present practically dependent upon corn, but more.

over cassava contains two other constituents worthy of consideration in this connection, namely, its 3 per cent. of sugar, against the 0·4 per cent. in corn and 1·68 per cent. of fibre, as compared with 2·20 per cent of corn.

"Manufacturers are now considering the importance of these facts, and there is good reason for expecting the erection of at least two gluco factories in the near future, which will depend upon cassava for their raw material." The same authority says in another report: "The actual profit on the feeding of the cassava steers was 48·42 per cent on the investment. The cotton seed steers returned a profit of 37·43 per cent, and the corn fed steers 14·98 per cent. The difference between lots 1 and 2 is decidedly apparent and shews cassava to be very materially the cheapest and best ration which can be used for fattening purposes. The most astonishing fact, however, is the very great difference demonstrated between the cost and the results of feeding corn and feeding cassava, the difference being almost two-thirds in favour of the latter. Cassava proves itself a most superior beef fattening food. The cost of live weight beef produced by feeding cassava is 1·1 cents per pound, and in 75 days a profit of 59·10 per cent was made by fattening beef upon cassava." The Tampa Herald says "The one thing necessary to secure for Florida an immigration that will convert our pine woods into paying farms, is the discovery and fixed establishment of a money crop; a staple that can be produced on every farm in the state, and which will always bring cash to the farmer in profitable volume so that he can every year have some surplus money to put in the Bank; unless he should prefer to enlarge or improve his farm. Now the Herald believes that this crop can be established by the cultivation of Velvet Beans, and Cassava, and the conversion of them into beef and pork. After all is said and done, meat is the great backbone of the North West, where more good money is made than anywhere else. Let the farmers and owners of lands demonstrate this fact, and they can sell every acre of their holdings to men that will push the stock business. We will have as many people as the land can hold. We will have a village with churches and school in every township. We will have a wealthy and powerful State. We can have it is our firm belief." In addition to the importance of cassava from the foregoing points of view I have the pleasure to state that I directed the attention of the Secretary of State for India four years ago to the utilisation of new varieties of this plant, (the bitter and sweet varieties have been known in one or two localities of India for hundreds of years) among the inhabitants of famine-stricken regions there. I pointed out that the cassava is peculiarly drought resisting, flourishing as it does in arid regions, as well as in humid regions. Thus about 14 inches of rainfall secures abundant crops, whereas for rice cultivation from 50 to 60 inches are requisite. I also pointed out that some of the varieties when cooked as Irish potatoes, rival that edible in point of palatableness. My letters on this subject have been published in India. A few months ago, I received instructions to furnish two Agricultural Departments in India with these special varieties for experimental cultivation. I have obtained these varieties from Colombia from sections of it, one thousand miles apart. During my residence in that Republic, many years ago, I detected the merits of some of these varieties. Thus co-incident with the intimation to hand of the great economic importance of one or two varieties of cassava in America, the acquisition of some 23 additional varieties is most opportune. Several of these are exceedingly rich in starch. And I have just despatched to Bombay and Punjab all the varieties. I am forming a nursery of them here, so that vast numbers of cuttings will be available soon. I purpose establishing a plot of each variety, with a view to determine their merits here. I am also forwarding immediately to the Agricultural Department at Washington the entire collection, also of the bitter cassava which is much richer in starch than the one under cultivation fo Florida. I am forwarding a supply for extensive propagation. Millions will soon be disseminated over Florida. Two varieties the "Bitter" and the "Sweet" have been cultivated here from time immemorial; they are also spread throughout the West Indies. Starch is made from the former for household purposes; from the latter cassava cakes are made and frequently the roots are cooked and eaten by the peasantry though the variety is inferior. Small patches are grown everywhere by the peasantry. The total aggregate may be 100 acres, consequently seed cuttings may be obtained for thousands of acres for immediate cultivation. Doubtless twenty thousand tons of root could be produced within a year. The cultivation is exceedingly simple; it thrives under the most diverse conditions of climate, on the Liguanea and other dry plains, on rocky hill sides, as well as on humid plains and hills wherever the soil is friable or gravelly. To obtain large crops it must be planted annually; it may be planted twice a year in Jamaica; the roots or tubers can be dried to keep for sometime; thus the weight is greatly reduced for transport to be brought from distant parts to a factory. I have mentioned that the factory at Orlando is in operation only four months a year. In Jamaica a factory can be kept going most of the year. It is impossible to exaggerate the importance of a great cassava industry in Jamaica. As a matter of fact an acre of it is worth more than an acre of sugar cane. We have cheap labour compared with Florida. The land is sufficiently rich without artificial fertilisers. A peasant can cultivate a few acres, each yielding at least ten tons at $5 per ton; this is $50 per acre. A factory here would confer immense benefit on the community.

MANGOES, &c.

Palm Beach is perhaps the most famous Winter Resort in the world. At one of Mr. Flagler's Hotels 400 rooms are added annually. The tropical aspect of the grounds is extremely grand; great avenues of palms, miles in length and forests of palms. The coconut plays an important part; thousands of them commonly 30 feet high are transplanted to command effect. Many other tropical plants are displayed here. There are also hundreds of acres of pineapples and the shed system is strongly advocated. One of the finest plantations is that of Mr. Mattham, and he has several hybrid forms from Washington. Mango and Avocado trees abound here; Mango fruit is extremely popular; hundreds of thousands are eagerly bought at about $7 per thousand. In the city of Key West the consumption is very large and its popularity is extending northwards, where in the near future it will doubtles become a staple fruit. My programme from Washington included a visit to a noted Mango grower, Professor Gale. He was delighted to show what he has done. Great Indian grafted trees as well as our no. 11 variety are propagated far more successfully than is the case in the west Indies,—by budding, grafting, and inarching. It affords me great pleasure to report that I obtained from the Director of Botanical Gardens at Washington six plants of a new variety of Banana; it is described amongst bananas as "the best fruit of any." My attention will be directed to its propagation with the least possible delay

EUPHORBIACEOUS PLANTS.

The veteran Director of the Botanical Garden, Mr. Smith, whom I have known for 25 years, suggested to me on my way to Florida, to consider and form an opinion, on the practicability, of cultivating Euphorbiaceous plants in this region. I therefore have the pleasure to submit a few remarks. In addition to the characteristic sandy soil of the east coast, another soil rich in humus abounds near Miami, vast areas of it, namely Everglade land. Heretofore nearly all experiments with tropical fruit cultivation have been conducted on the sandy soil, where sub-tropical fruits mingle with purely tropical fruits. In this region frost is practically unknown, coco-nuts thirty years old flourish here, large mango trees, avocado pears with large trunks, some of which must be over twenty years

old, rose apple, tamarind, guava, cotton tree, naseberry (sapodilla), ponciana regia, and many tropical palms. This affords substantial evidence of the capabilities of soil and climate. The widely dispersed pine forests cover great tracts; oaks are scrubby. In this region, therefore, many tropical as well as sub-tropical forms flourish, forms that withstand the reduced temperatnre of the cool season. At the same time the sub-tropical conditions are typical, for oranges, grape fruit trees, &c., grow with remarkable vigour. I have had a wide experience in the cultivation of valnable economic plants at altitudes ranging from the sea level up to 10,000 feet in the tropics. In this connection, near the eqnator it is interesting to observe that at an elevation of 6,000 feet mangoes, avocado pears grow side by side with exceedingly fine oranges, just as they do in Florida. At this elevation in the Colombian Andes up to 8,000 feet one of the most important species of rubber is indigenous, I started the cultivation of a plantation of this tree in its native habitat. This plantation was abandoned at the time extensive Cinchona plantations were abandoned. The rubber tree grew with great rapidity, twenty feet high in three years. It is a very distinct form of *Sapium biglandulosum.* More than a year ago I had the pleasure to direct the attention of the secretary of Agriculture to this important plant. I now beg to say that I have carefully considered at the snggestion of Mr. Smith of the Botanical Garden, the conditions at Miami compared with those on the Andes at 6,000 feet. In the forest at this elevation Oak tree abound; there are several species of coniferous trees. Close to Miami I found many indigenious species belonging to natural orders that grow at 6,000 and 8,000 feet in the Colombian Andes, for instance, many forms of Rubiaceae a characteristic order at this elevation (amongst Urticaeae I detected at Miami a congener of Ramie with a beautiful fibre) These analogous conditions couple with the fact that Oranges, &c., flourish at the same elevation at which this rubber tree grows led me to the conclusion that the conditions presented near Miami on the beautiful lands of the Everglades distinctly point to the practicability of growing successfully this species of rubber thereat. Where this tree grows the rainfall is more than one hundred inches a year; it delights in water at the roots when thoroughly drained. Hence irrigation from the beautiful Miami River could be made snbservient.

Halfway Tree, August 27th, 1901.

—*Board of Agriculture, Jamaica.*

THE HŒVIA "PARA," INDIAN RUBBER:

ORIGIN OF THE INTRODUCTION AND CULTIVATION OF THE TREE.

BY H. A. WICKHAM*

Although advertisements for sale of the seed of Para rubber (*Hœvia*) at so much a thousand have now been commonly seen for some time past in all the planting journals in Ceylon and the East, it is not generally known that to the initiation of the Government of India is due the fact that they are within the reach of the planting community at all. Any planter who has had practical experience with the seed of this tree will understand the difficulty which had to be encountered in getting the original stock plants established in the Eastern tropics at such distance from their primitive home in the highland forests of the valley of the Amazon.

*Planter, and some time Commissioner for the introduction of the *Hœvia* (Para) Indian rubber for the Government of India, and inspector of forests.—B.H.

In the first instance, so far back as the seventies, the initiation of the Government of India in backing liberally the recommendation of Sir Joseph Hooker enabled me to seize an opportunity, singularly occuring for specially chartering a steamship which happened to be up the Amazon River at the exact time of the fall of the ripe seed in the rubber forest. Had this not been so, I should never have been able to accomplish the feat of securing the large original stock from an only seed so prone to quickly lose vitality.

Just now there seems to be a disposition in some quarters to deprecate the efforts made by the Indian Government as bearing on the method best for the cultivation of the *Hœvia.* This seems to be exceedingly short-sighted and ill-advised. As a matter of fact, in the hands of the Government of India, through their forestry, officers, all such experimental planting or cultivation cannot be calculated to be other than object lessons of the greatest value to practical planters in all the equatorial colonies, in that it will furnish them with authoritative data (especially the *Hœvia*) of a nature to be depended upon.

The true "Para," Indian rubber (*Hœvia*) is to be found growing naturally within the immense forest-covered area of the valley of the Amazon and in the tributary rivers, including the head streams of the Orinoco. I found it abundant high up on the Orinoco, above the junction of the Guaviare (the latter stream by right, indeed, should be styled the head stream of the Orinoco). It is plentiful on the banks of the Cassiquiare—that curious bifurcation by which the Orinoco gives of a stream to the Rio Negro, and so converts Guayana into an immense island. I also found it growing in the interior betwixt the Tapajos and the Xingu. The rivers from which the largest supply is drawn now by traders are the Purus and the Madeira. In its native forests it grows dispersed among the other forest trees, two or three trees rarely being found in juxtaposition. In appearance the *Hœvia* is a handsome tree, with straight cylindrical trunk—differing wholly from the Ule—the Indian rubber tree (Castilloa) seen in Moskito and Nicaragua to South Mexico. The wood is soft and perishable. The bark, as in the great majority of tropical trees, is not very thick, and is of a grey colour on the surface, but when scraped, approaches the appearance and colour of a light bay horse's coat. This cleaning has to be done, as in moister regions the bark is thickly coated with growths of moss, ferns, and orchids. The seeds grow, three together, in a sort of hard pod. This pod, becoming heated by the sun, bursts when it is ripe with a sharp popping sound, and scatters the seed for a considerable distance around the tree. The seed is exceedingly oily, and the oil extracted therefrom, closely resembling linseed oil, is a valuable product. The range of temperature in the *Hœvia* forest is between 70deg. and 90deg. throughout the year. Rainfall varies considerably in different districts where *Hœvia* are found, some districts being nicely divided into wet and dry seasons; each of about six months' duration, while in others it rains more or less the year round. In such districts it is more difficult to collect the *caoutchouc* profitably, as if the stem of the tree is very wet when it is worked, the *latex*, or rubber-milk, spreads over the surface, of the bark, and is in large part lost. From what has been said it may be seen that the main part of the Indian rubber must be collected during the dry season, although "siringaros," who live near their "siringals," or rubber walks, improve their opportunity by tapping their trees whenever fine days occur during the rainy season. But the trees are doubtless better for a half-yearly rest.

When the native hunter has discovered for himself a district of the forest in which "siringa" trees are sufficiently numerous and near together he first connects them together by cutting a "picado," or path, with his bush knife. Having thus discovered their relative bearing, he next straightens and clears out his paths, endeavouring at the same time to

take in as many trees as possible in each path, and to make all the paths converge to a certain spot, where he puts up his "barrica," or curing station. This done, and having collected a supply of the old nuts of the *inaja* (Maximiliana regia) or similar oily palm nuts, he is ready to commence operations on the first fine day. There is some diversity in the manner of taking the rubber *latex* in the Amazon Valley. In some districts they prepare long strips from the inner pith of the foot-stalk of the leaf of the *inaja* or of the *bacaba* palm. These are tacked obliquely round the stem of the trees, with sharpened pieces split out of hard covering of the same leaf stalks. These strips, being smeared on the inside with wet clay, form a channel for collecting and conducting the *latex* milk into the cup placed to receive it. In the other method, which I consider the better, the cups are put on in a ring round the trunk, usually a span apart. Three cuts about 1½ in. long are made in the bark with a small axe. In this way the number of cups is proportioned to the size of the tree. Tin cups are used. They are made slightly concave on one side in order to fit the convexity of the tree trunk. They are attached to the tree by the use of a piece of the ball of kneaded clay, which each collector carries in his bag. The tapping always begins as soon as there is light enough in the forest path to see by. One man is usually apportioned to each path, containing say, 100 trees. When he has cupped his trees he sits down at the end of the path for half an hour or so, but as soon as he sees that the tree last tapped has ceased to drip the milk, he starts at a trot on the back track, detaching and emptying the cups into his calabash as quickly as possible. Speed throughout is a great object, as the milk *latex* speedily coagulates, and then can only be sold on the market for an inferior price, as *serwambi*, as compared to that obtained for that which has been smoke-cured. When the men arrive at the central hut from their different converging paths they each empty their quantum of the *latex* taken for the morning's work into one of the large Indian native earthenware pans, usually used as a receptacle. Care is taken to squeeze out with the hands all of the already coagulated curd-like masses. These are thrown on one side to be made up into balls. Earthen pots in form of miniature kilns are placed over small fires, and the "siringero" sits down to the really tedious part of his business. He drops a handful or so of the oily palm nuts down the narrow neck of the kiln, and forthwith arises a dense smoke. Taking a wooden mould—like an ace of spades in form—and holding it over the pan, he pours some of the *latex* over it in a thin film keeping it turned, so that it shall not run off before he succeeds in setting it to an even surface, which it soon does as it is passed backward and forward through the column of smoke. This is continued, one coating after another, until he has finished the day's supply of rubber-milk. He then sticks his mould up in the thatch of the roof of the shed for the repetition of the process next day, and until he finds the thickness of the *biscuit* makes the mould unwieldly to handle, when it is cut down one side, slipped off, and stored. This is the native method, which can without doubt be improved upon under conditions of systematic cultivation.

But as all the stock of plants or seed available for the planting and cultivation of this tree in the Eastern tropics are and will be derived from direct lineal descendants of some or other of those 7,000 odd originally introduced by me at the instance of the Government of India* in 1876-77, it may be well if it be recollected that their exact place of origin was in 3deg. of south latitude, and to remember their natural conditions there. This the more so since a very general error seems to have obtained that swampy or wet lands are the fitting locality for the *Hævia*. This would seem to have arisen in that the "explorer" of a few years' experience would have some of these trees pointed out to him (naturally in answer to enquiries) growing scattered along the wet margins in going up the lower Amazon or tributaries, whereas the true forests of the "Para" Indian rubber tree lie back on the highlands, and those commonly seen by the enquiring traveller are but ill-grown trees which have sprung up from seeds brought down by freshets from the interior.

As a matter of fact, the whole of the *Hævia* which I procured for the Government of India were the produce of large-grown trees in the forest covering the broad plateaux dividing the Tapajos from the Madeira rivers. The soil of these well-drained, wide-extending, forest-covered tablelands is a stiff soil, not remarkably rich, but deep and uniform in character. The *Hævia* found growing in these unbroken forests rival all but the largest of the trees therein, attaining to a circumference of 10 ft. to 12 ft. in the bole. These forest plains, having all the character of widespread tablelands, occupy the space betwixt the great arterial river systems of the Amazon, and present an escarped face, which follows, at greater or less distance, and abuts steeply on the *igapo* or *bagas* —*i.e.*, the marginal river plains—subject to inundation by the annual rise of the great river. So thorough is the drainage of this highland that the people who annually penetrate into these forests for the season's working of the rubber have to utilise certain *lianas* (water-bearing vines) for their water supply, since none is to be obtained by surface-well-sinking, in spite of the heavy rainfall during great part of the year.

The *Hævia* is much more amenable, better adapted for systematic cultivation, planting, and working than any other of the rubber-yielding trees with which I am acquainted—for instance, the *Ficus elastica* of the Eastern tropics or the *Ficus regia* of New Guinea, and probably of Malaya; the various species of jungle rubber *vines* of the East and of New Guinea and tropical Africa; and, to a less degree, the *Castilloa* and *Ceara* of tropical America. The remarkably shapely cylindrical form of the lower trunk (the workable part of the tree) from the ground upward renders it singularly adapted to regular extraction of the rubber *latex*, and although the *latex* of the *Hævia* does not appear to lend itself to the process of separation by centrifugal separating machines, as do the *Castilloas* of Guatemala and Southern Mexico, the "Para" rubber, produced by a simple smoke process which has been devised, always commands the best market price.

In New Guinea I was in 1894 first to discover a vine growing in the forest there which produces a very fine quality of Indian rubber. There is also a large forest tree, native of these forests, (a species of *ficus*) which yields a good class of rubber in quantity. None of these, however, being so suited (so amenable) to cultivation in plantation as the "Para," it is much to be recommended that cultivation of the *Hævia* be encouraged in that late and undeveloped possession of the British Empire. Now that it has been established in the East, there should be no great difficulty in bringing it down from Singapore; and I have myself seen large tracts of forest and jungle land in New Guinea which are admirably adapted for the planting of this, the premier rubber-producing tree.

The conditions required for the successful and profitable cultivation Para (*Hævia*) Indian rubber are in my opinion, that it be regarded as a plantation —a *cultivated* product— rather than as one to be planted with view of being widely disseminated, under canopy, of an area covered by primitive standing forest. This opinion, formed at the time of the original introduction of the *Hævia* to cultivation at the instance of the Government of India in 1876, has been strengthened by subsequent years of planting experience; and I am convinced that any advice for the setting out of the *Hævia* rubber-tree as a self-disseminating forest product—*i.e.*, planting it out under canopy through wide areas of existing forests or jungle—will be

found to be founded on fallacy. The *Hævia* has no light-winged seed, as mahogany and others. On the contrary, although the seed is scattered to some extent around the parent tree by the bursting of the ripe triform pod, it should be remembered that the seed is in form an exceedingly heavy and oily nut, and falls thickly in a circumscribed area. Even there it is exceedingly attractive to every four-footed creature of the jungle, who devour it greedily. In its own forests it owes its preservation only, as I think, to the fact that very venomous and large snakes, the *saracucu*, are in the habit of lying in wait about the base of these trees in seeding time, and so award off to a great degree the agonti, Indian rabbits, and other rodents. Forest deer, also, in my experience, are very destructive to the young plants. In any case I have found that *Hævia* take at least three times as long to come to productive size grown under forest shade as under plantation cultivation free from top shade. Lateral shade to the extent required, at first, for formation of a straight trunk form is readily got by allowing intermediate "second growth" to come up between the young *Hævia*. For myself, I have known these trees, when grown in the open, seed abundantly in three years, whereas they would have taken 10 to 12 to do so in the shade of the woods. It is therefore recommended that *Hævia* should be systematically grown in cultivated plantation. For spacing distance I advise the half chain (33ft. by 33ft.) diagonal, as giving more root scope. This gives 40 trees to the acre. Besides being a good distance, the half chain is of practical advantage in marking off forest land, as by opening lines with the prismatic compass or theodolite, the man following can plant the seed to stake as the chain is drawn over the lines. As soon as the young trees attain proper trunk form the more light and air they are given, and the cleaner they are kept, the stouter and quicker will be their growth, and in the fourth to fifth year they would be in condition to yield to a first tapping for rubber *latex*—say, by using two cups taking on an average a pound (1lb.) of rubber during the drier season of that period. The empty tins used for "preserved milk" answer admirably for this purpose, as they are of about the right size, and being made of thin tin readily bend to the shape of the tree trunk. The operation if carefully done will not arrest the growth of the tree. It is rather shown from experience that accumulation of the *latex* in the bark of the trunk of the trees is augmented thereby. For purpose of extraction there has yet, as I think, been no better instrument devised than the ordinary carpenter's chisel, carefully used with a light mallet. The cuts (three oblique cuts one above another, should he clean cut, and should not penetrate into the wood of the tree. Caution should be exercised in this respect, as if the wood is injured certain species of boring beetles attack the tree. The spacing should be about a span apart, one circle round the trunk of the tree beginning at the ground surface for each day's tapping; and so giving an increased number of cups in use as the tree grows in circumference, with proportionate increase in yield of the *latex*.

One advantage of the close system of cultivation recommended, besides greater economy in working is that centrally-placed curing stations can be secured. This is necessary in order that the *latex* may be quickly treated, so soon as it is taken from the trees, or much of it will become coagulated before it could be subjected to the smoke-curing process, and so lose the higher market value.

The *Hævia* is naturally a large tree, under favourable conditions attaining a girth of 12ft. in the bole. To stint it in matter of root space or scope will be found to be false economy. I would, therefore, strongly deprecate closer planting than that recommended—half chain (33ft. by 33ft.), 40 to the acre. Planted and cultivated at this distance, and giving say, 5lb. of rubber per tree at 3s. only per pound, it would yield at the rate of some £30 per acre for sale of rubber alone, apart from value of the seed crop, to be converted into oil worth £25 to £30 per ton.—*The Contract Journal*, Jan. 8, 1902.

COFFEE CULTIVATION.

The Cultivation of Coffee throughout the world is the subject of an interesting geographical study, illustrated by maps, by M. H. Lecomte, in *La Geographie* June 1901. The subject is treated in three sections: the geography of the natural species of Coffee; the distribution of coffee-growing throughout the world; and the consumption of coffee in various countries.

The coffee-plant belongs to the genus *Coffea*, of the family Rubiaceæ. The latter, which is the fourth in the numerical importance of its species, is distributed chiefly in the warm regions, and no travelling botanist can fail to remark the great abundance of the Rubiaceæ in tropical forests. This family is, on the other hand, poorly represented in temperate lands; although it includes, in all, more than 300 genera and 4,000 species, there are no more than 6 genera and 60 species in France, and only 14 species in Belgium. The tropical flora is incomparably richer in the Rubiaceæ; indeed, it would be easy to show that the family is one of the most extended in tropical regions. Oscar Drude states that 75 per cent. of its species are tropical and affect especially the hot, damp forests. Of 712 species of the Congo Free State, described by Durand and Schinz, the Rubiaceæ come first with 75 species, the Leguminosæ second with 73, then the Compositæ with 64, and the Labiatæ with 33. This family includes a considerable number of useful plants, e.g. *Cinchona*, *Cephalis*, *Ipecacuanha*, *Rubia tinctorum*, *Uncaria Gambir*, etc.

The species which is most cultivated is *Coffea arabica* L. Notwithstanding the general opinion, it is improbable that the shrub is a native of Arabia, where it has never been found wild; it has, on the other hand, been long known in Abyssinia, where it is called *Boun*. The Abbe Raynal thinks that it is a native of Abyssinia, and that it was carried into Arabia by Ethiopian conquerors; and Charles-Jacques Poncet, who travelled in Ethiopia in the years 1698, 1699, and 1700, reports the cultivation of coffee in that country.

This is not the only species which is native to Africa; a large number are known both on the east and west coasts. On the west coast there are 22 species. The indigenous species of Asia are all mountain plants.

Of the numerous species of coffee the *arabica* is the only one largely cultivated, though recently one or two other species have been grown to a small extent; but all the species which can be utilised belong to that region in Africa between 15° N, and 15° S. latitude. The Asiatic varieties have no commercial value, and in Amercia where it is so much grown it is not indigenous.

Till the beginning of the eighteenth century Arabia held a monopoly in the cultivation of coffee. It was shipped to Europe direct from Arabia by the cape, or was purchased in Egypt, whither it had been brought across the Red Sea. Attempts to grow it from the bean were so unsuccessful that it was supposed that the Arabians soaked the beans in boiling water or dried them in hot furnaces. At the end of the seventh century however, the beans germinated perfectly at Batavia, so that to the Dutch belong the honour of first acclimatising the coffee plant outside Arabia.

The Governor of Batavia sent a plant to Amsterdam and a specimen was brought to France by Lieutenant de Ressons. It was placed in the *Jardin des Plantes* at Paris and bore flowers and fruit, but did not live long. In 1714 the magistrates of Amsterdam gave a new plant to Louis XIV., and it was sent to the royal garden in Paris. From this coffee plant sprang those which were transplanted and have multiplied in the French colonies. The first attempt at acclimatisation was made at Martinique in 1716, but this was a

failure. In 1723, however, Captain de Clieux, who was voyaging to Martinique, was intrusted with a plant. The story of his devotion has often been told: the passage was long and perilous, and fresh water became scarce. De Clieux, who was impressed with the importance of his commission, and anxious to secure a new source of wealth for his country, shared his meagre supply of water with the precious shrub, which, thanks to his care, reached Martinique in good condition. At the first harvest it yielded two pounds of beans; these were distributed over the Island, and in February 1726 there were nine trees twenty months old, 2,000 smaller ones, and many more just above ground. An unfortunate event hastened the development of coffee culture. Till then the chief industry of the country consisted of cocoa plantations, but a severe earthquake, in 1727, destroyed the plantations, and the colonists in future grew coffee instead of cocoa. Soon Martinique produced more coffee than could be consumed in France.

From Martinique the coffee plant was carried to the other Antilles, and to Central and South America; and now, after less than two hundred years, the countries of America and especially Brazil, are the chief producers. In Java, where the first attempts at acclimatisation were made about two centuries ago, the development of the Industry has not been great; Arabia, which used to supply Europe, now produces a very small quantity; and Martinique at present produces scarcely enough for home consumption, and Brazil, where cultivation was insignificant a hundred years ago, is now the great producer.

Numerous and very various are the circumstances which determine the principal subjects of cultivation in any country. The full study of these conditions is of great interest, but only a few of them can be mentioned, such as climate, character, and fertility of soil, means of communication, cost and quality of labour, the history of colonisation, the influence of governments, the taxes in the lands of production, and the tariffs, in those of consumption.

As regards the New World, one may say roughly that coffee is cultivated between the tropics; but not all sections of this vast region are equally suitable for it. In the east there are no important plantations near the Equator; in the west on the country, there are very extensive plantations in the state of Ecuador, for the high mountain chain makes it possible to cultivate at a considerable altitude and also prevents that dry season which occurs in all mountainless equatorial regions. This is certainly the reason for the success of coffee growing in Ecuador; for close to the sea, where the annual rainfall is very small, it is not possible to grow it. The same may be said of the coast of Peru.

Brazil is the choice country for growing coffee. Till the beginning of last century Brazil did not grow much, but now it produces three fifths of the coffee which finds its way to the markets of the world. At first the plantations were confined to the province of Rio, then they stretched north to the province of Spirito Santo, latterly they have been extending south into San Paulo and even into Minas Geraes. Some of the plantations are enormous. There is one, thirty kilometres from Ribeiro Preto, which covers 6,000 hectares and contains 4,700,000 coffee bushes. 8,000 Italians are employed to work it. It is estimated that in the year 1900-1901 Brazil will have exported 9,000,000 bags of coffee.

Coffee is also ground and exported by Dutch Guiana, Venezuela, Colombia, and all the states of Central America; Cuba, Jamaica, Porto Rico, and Martinique, all produce a little, but not so much as formerly. In Africa, coffee is grown principally in Abyssinia and the Congo State. The industry has also spread to many of the islands in the Indian and Pacific Oceans.

The countries where most is grown are between the tropics, but not close to the equator. The New world holds the first place, actually producing five-sixth of the world's supply, and this accounts for the influence of the American harvest on the price of coffee. Since 1895 the price has been going down steadily, because of the enormous Brazilian crops. These, however, come from the virgin soil of the province of San Paulo, and its productiveness is bound to diminish unless the planters enrich the soil, which they can scarcely afford to do at present prices.

It is difficult to estimate the amount of coffee used in the countries where it is ground, but very easy to arrive at figures for non-producing countries. France uses about 1·82 kilog. per head per annum, England ·39, Belgium 3·85, Russian 1·15, Italy 1·42, United States 3·95. Several facts are worth noticing in this connection. Northern European countries drink a great deal more coffee than Southern European. In all countries where the consumption is important it increases rapidly each year. The small amount used in England is counterbalanced by the large consumption of tea. The use of coffee is steadily increasing from year to year, and the increase would be still more marked if both coffee and sugar could be imported duty free; but the influence of tariffs must not be over-estimated, for the duty paid in France only amounts to two centimes on every cup. The fact that more coffee is used in France than in Spain, and more in Sweden than in France seems to indicate a decided climatic influence on the use of such beverages as tea and coffee.—*Scottish Geographical Magazine.*

FIBRES:

RHEA FIBRE CULTIVATION IN CHINA AND INDIA.

INDIA NOT A FAVOURABLE FIELD.

The writer has had considerable opportunities of investigating this rather vexed question in both countries, combined with some practical experience, and in the former country, under the auspices of the Chinese Government.

As various schemes are being continually brought before investors in this country, and considerable sums of money lost in attempts to bring them to a practical conclusion, to which in former times the Indian Government have on more than one occasion lent financial encouragement, the information the writer has gained may possibly be of some interest to the planting and commercial community.

First, investigations were made in India as to whether the extended area of cultivable land available, through the completion of the various Government irrigation schemes, such as the Periyar, would afford any opportunities or advantages to the people in the introduction of rhea cultivation.

The experience of the authorities, however was that all land as it became available under these schemes, and was thrown open to cultivators, was easily disposed of to native buyers for rice, etc., cultivation. So long therefore as land continues to be eagerly taken up for the production of food stuffs, there would apparently be no public object gained in replacing their production by fibre cultivation, unless the latter could be sandwiched in as a rotation crop. Rhea not being an annual but a permanent crop, and not succeeding in flooded land such as rice districts, it is therefore not available for that purpose as jute would be.

Generally the conclusions so far come to, do not establish that India in any part, is in any sense a favourable field for the introduction of the industry.

There is no doubt that China is at present the only country of prodction in commercial bulk, and it remained therefore to be seen whether investigation into the conditions of successful cultivation in that country would throw light upon, and explain the reasons for, its non-*commercial* success in India, and elsewhere.

The production in the provinces of Hupeh Hunan, and Szechuen is very large. For manufacture into the finest classes of goods, much of it is shipped to

Canton, Swatow, and other Chinese ports, and the whole production is practically consumed internally, the small export to Europe being of no account. The fibre fulfils all the purposes in China that flax does in England. Clothes for summer wear, shoe, thread, fishing nets, bow strings, twine, rope, and sail cordage, etc., etc.

Investigations into, and practical experience of the Chinese methods of cultivation, revealed much that was useful and instructive, and practically, the writer thinks, explains the whole position, and not favourably possibly to the introduction of the industry in India or the Colonies, under European supervision in large blocks, *i.e.*, on the estate system.

The fibre is undoubtedly indigenous in China, growing as a weed along the roadsides, and in the crevices of the City Walls, therefore, even the delicate seed must find a congenial home and survive the winter, which is sometimes as severe as in England, but of course the commercial yield is from cultivation solely. Now in India, it is difficult to produce from seed with the greatest care, and where the plant has been imported into a new district, the seed absolutely will not germinate, presumably from the absence of a fertilizing agency.

The experience of cultivation in India, was that taking freshly felled forest land with rich alluvial soil, the plant gave luxuriant crops of great height for about 15 months, gradually declining, and the ground was then so completely exhausted, that weeds would hardly grow.

The plant of course is purely a surface feeder. In a short time the roots meet, and become a solid block, and although of course all experiments in digging, root pruning, and turning up the soil were exhausted, and are practised, the plant being a permanent one and not an annual, it is not really possible to give the plant fresh turned soil in an efficient way after each crop, without taking the whole plantation up, which, of course would involve interruption to growth, for the best commercial crops are not really gained until the second year. The writer believes the experience of other planters has been the same, not only in India, but other places, and such manuring as is within the average range of an Indian planter, say once a year even, including replacing stems and leaves, did not put the land into condition again or produce any commercial results, even such manuring as that would probably be impossible in large blocks.

How then do the Chinese continue to produce successive commercial crops? In China every particle of human excrement inclusive of the cities is conserved and put on the land, and there is little doubt that if we ever interfered with their system, by our sanitary regulations, we should probably ruin the country. The liquid manure collected in tanks, after a sufficient time to a low fermentation is brought down to the river and shipped in junks by contractors who supply the farmers; the solids are deposited on the river banks, turned over, mixed, tempered, fermented and then similarly dealt with. It is all applied to the land in the liquid form and the Chinese will not use animal manure in preference, or on the same level, on the ground of want of strength.

The China Grass receives two applications of the strongest liquid manure *each* crop, starting from the time of planting, first immediately after cutting crop, and the second in ten days, and a plantation is calculated to last about ten years, the roots being cut from time to time. Even with all these advantages, while the results are successful and commercial, there are no points to give away as regards the value and length of the crop.

This it appears is how the exhaustion of the land is got over, and *successive* crops maintained, and it would appear, therefore, to be idle for anyone to embark in any cultivation schemes, except they can find at least equally favourable conditions as the Chinese possess, *i.e.*, they must be prepared to manure richly twice in each crop. This condition does not appear likely to fall in with large blocks under European ownership and supervision, although reference may be made to the possibility of artificial fertilizers, the result would be exceedingly dubious, if only on account of their slow assimilation, in a necessarily quick growing crop and of finding the right one, combining all the necessary elements in a form that can be at once drawn upon by the plant.

The statistics and estimates of yields, etc., which often occupy so important a place in prospectuses seem to be really of very little importance. The land responds exactly in proportion to the generosity of treatment it receives, yield is heavy or light in proportion. There is no difficulty in getting a remunerative yield, given the necessary conditions. However rich any available site of virgin forest soil may be to start with that practically only governs the situation for the first period of 15 months. when in any case manuring must begin on the Chinese system, and the real question is always the average yield over, say 10 years. Sites therefore are not of premier importance.

The only point of importance or improvement the writer could see that could be added to Chinese methods, is that they do not trouble to irrigate. Thus on a dry season, they often lose the best growing time, viz., the hot weather, and a short length crop follows, This is well known on the market.

There are, however, some other very important details to be learned from the Chinese. The writer has seen in European hands, the crop laboriously gathered by cutting each stem with a knife, with much injury to the young shoots that are to form the next crop. The bulky result containing only 3 to 5 per cent. Fibre is then bundled and carried off the field to the factory, decorticated by machine or hand, and the refuse, stems, etc.. actually carried back and spread over the land.

The Chinaman knows better, and does not cut the crop at all. He simply snaps the stem near the root whereupon the fibre opens of itself at the break into two ribbons, inserts his fingers, runs them up, and with a slight pull decortication and cutting are done at one operation, actually taking less time, than mere cutting would do, and leaving each stem and its leaves on the ground in their own place. Thus the whole cumbrous foreign method and its immense cost and extra labour is disposed of at one stroke.

It is evident therefore that decorticating machines have no place, and are absolutely superfluous, because the stems would have to be cut, if they were used, and this, together with the handling the bulky crops of stems on and off the field that has been the bugbear of all European devised scheme, are difficulties that really never existed if an investigation of existing method in China had been made.

The operation above mentioned of course gives ribbons with the brown pellicle on, and where these have to be cleaned, which with modern degumming processes is not at all always essential, the Chinese method has been again grossly exauggerated in difficulty and cost, I have seen descriptions stating that each ribbon was tied to a book and tediously scraped with a knife, the work being only one pound daily. As a matter of fact the Chinese cleaner has a knife sharpened like the blade of a trowel, which he holds in the palm of the right hand, on his thumb attached to a ring he slips a small piece of bamboo, he then takes a *handful* of ribbons (green) in the left hand, and draws them rapidly between the knife edge and bamboo, then reverses and cleans the held end. The whole thing is exceedingly simple, quick and easy, and the average work tested is 10 lb. cleaned dry fibre per man per day, and as it is really done either in spare time or by the women and children, of no cost as regards any competition by decorticating machines.

In any case if decorticating machines were used the cultivation difficulty being first got over, it would obviously be more economical to decorticate the stipped ribbons in the machine for the purpose of cleaning (gathered in the Chinese way) than the bulk of stems, with the carrying off and on the fiel

Three crops are taken in the year, the time for growth and maturity being about the same as in India, viz., about six to seven weeks.

The writer does not go into the question of yield, which appears satisfactory because the matter seems more to turn upon the other points mentioned.

The native yarn is spun without any twist, which gives it great covering power in the cloth, that is the cloth will be 30·40 closer, or less threadbare, than if made from machine-spun yarn of the same weight, and being spun in the gum, it is perfectly smooth and hairless, without any expense in finishing machinery as is required in machine-made yarn and cloth. The hard grass is wetted, and then shreded into the requisite size, the lengths being joined by a dexterous twist of the fingers, as the thread is wound on a reel continuously. Yarns of astonishing regularity and fineness, are thus produced, and the operation is surprising in its dexterity and result.

It may be interesting also to mention that the Chinese are extending the cultivation of jute, and with the immense area of rich alluvial soil they possess in the great river basins, and their powers of cheap production, India may shortly be seriously threatened in this industry.—*South of India Observer.*

THE ORANGE.

At a recent meeting of the Renmark Agricultural Bureau Mr. C. R. Rose read a paper on "The Orange" to the following effect:—

The orange is of comparatively modern introduction in horticulture. It is not mentioned in the Scriptures, nor by Herodotus, who lived five centuries before Christ, and who wrote a list of fruits then known, nor by Virgil, who wrote much about such matters 100 years before the Christian era. The orange came originally from the south of China, Burmah, and India. It is found growing wild in the jungles in various parts of india. The Arabs introduced the orange to their country, and thence it got to Syria and Southern Europe. This was probably the bitter orange. The sweet variety was brought to Europe about the forteenth century by merchants of Genoa or Portugal. Thence the tree was passed by the Spaniards and Portuguese to the Azores and other parts of the "New World," and found congenial conditions. Mexico. Florida, California, proved to be highly suitable. The St. Michael orange originated in the Azores; the Pernambuco and Bahia, (or Navel) were both named after provinces in Brazil. The orange is now found growing in nearly every country where there is enough sunlight and absence of severe frosts. The orange tree seems to thrive in many different kinds of soil. In the Azores the soil is intensely volcanic, which is highly suitable, but in Renmark the tree grows on sand and on stiff clay with equally good results, but the growth is more rampant on the sand; so that it may be fairly concluded that as long as there is sufficient nourishment and moisture in the soil, combined with proper drainage, the orange will do well. The essential in nourishment are chiefly potash, nitrogen, lime, and phosphoric acid, together with several other substances in small quantities, which are almost universally distributed in all soils. Even when all the necessary constituents of plant food are originally present in the soil some or all of them will in time become more or less deficient when crops of any kind are grown without restoration by means of fertilzers. The farmer's land is not racked by crops all the year through, but the orangery is making calls on the soil during the whole time. It is a mistake to starve fruit trees, but the application of manures on too liberal a scale will produce a rank growth of wood with little or no fruit, or there may be an excessive crop of undersized oranges. The first defect is due to too much nitrogen, the other to an excess of phosphoric acid and lime. A moderate dressing with fertilizers each year is better than one heavy application every three years. If a tree has sparse and few leaves, and there is no lack of moisture, we may reasonably conclude that nitrogen is lacking in the soil, but if there is vigorous growth and little fruit it is probable that lime and phosphoric acid are needed. Drainage is necessary where there is an excess of water, but with the scanty rainfall and regular irrigation at Renmark the danger is reduced to a minimum, the ground should be kept damp, but never swampy. In winter the soil must be kept moist, as at that time the trees are maturing a crop and forming buds which are to supply the crop of the succeeding year. Moisture in winter prevents the tree suffering from the effects of frost. Renmark settlers cannot wait long enough to propagate trees, so they must procure them ready for planting out from the nurseries, and they must carefully guard against the introduction of Icerya purchasii and other insect pests as well as fungus diseases. There should be a law against the introduction of diseased trees as well as against diseased fruit. There are about twenty-five species of fungus diseases, and very many kinds of borers, scales, beetles, caterpillars, and other insect pests affecting fruit trees and vines in Australasia, but very few or none of them at present are found at Renmark. We owe it as a duty to ourselves and our neighbours to maintain a vigilant lookout for the first appearance of any pest or disease, and should such appear to use the most vigorous and effective means to at once suppress it. [The essayist here drew attention to a pamphlet issued by the Agricultural Department of New South Wales dealing with such pests and diseases and the remedies to be adopted. He might also have quoted a similar pamphlet issued by the Central Agriculture Bureau of South Australia some time ago. He objected to the cyanide of potassium treatment for insect pests, because the cyanide gas is very poisonous to human beings, and because the application must be made when the sunlight is strong, but both objections are untenable in the face of the great efficacy of the treatment, and the fact that arsenates are constantly used with safety although very poisonous.—Gen. Secretary.] Newly-planted orange trees must be sheltered, the soil must be constantly maintained in a free and open condition by the use of the hoe, especially beneath the branches of the trees, where there is a favourite breeding harbour for grubs and all sorts of insect pests. In regard to pruning the orange tree should be in a solid compact mass, like a well-built haystack. To attain this allow the tree to grow in the centre, and at the same time shorten the lateral branches. The fruit should be gathered with great care to avoid bruising. In August, 1895, the writer planted 600 orange trees, and now the average height is 10 feet., girth round the branches 30 feet., the butts at 1 feet, from the ground average 15 ft. These are Washington naveels, Seletta tree, six years old, which produced 500 oranges. The fruit from this orangery has taken eight first prizes at shows in Adelaide, Mildura, and Renmark. Much damage is done to Renmark fruit by exposing the cases on open trucks, coverd with a tarpaulin, between Morgan and Adelaide, when the shade temperature reaches 100 deg, or more. Some effort should be made to secure an alteration in this respect.

Discussion took place upon the best kind of stock to bud or graft the orange upon, but no conclusion arrived at. Re-fumigation Mr. Rose said the cost of fumigation with hydrocyanic acid gas is very small after the first cost of tents, and that fumigation kills every insect on the tree, whilst spraying always misses a number of them.—*Adelaide Observer.*

RUBBER CULTIVATION IN VERA CRUZ.

TO THE EDITOR OF THE "INDIA-RUBBER AND GUTTA-PERCHA JOURNAL."

DEAR SIR,—I will in this letter confine myself to the work in the nursery. After the woods are burnt off, the best location for a nursery should be selected,

if possible somewhere near to the centre of the land to be planted, as rubber plants, if well grown, are very bulky.

The selection having been made, begin by gathering up all the unburnt logs, place into piles and burn. Then dig the whole location over with mattocks or pickaxes, about one foot deep, taking out all small trees less than 6 inches thick; pile all this on one side of the nursery, as it will be too green to burn. Now go to work with a good stump puller, and pull out all the stumps that the machine can handle without breaking it, or the wire cable. Very often it will be well to help the puller by cutting the roots of some of the largest of the stumps As soon as they are pulled out, all the earth between the roots should be dug out with mattocks, so as to allow the stumps to dry as soon as possible, when they can be burnt or removed to one side.

As soon as the stumps are all removed, go to work and rake up all the chips, clean, carry them away, then level off the ground, because pulling the stumps make very large holes; now plough the ground about 6 inches deep, then harrow with a good heavy harrow and cross harrow, and if the clods are rather large go over the ground with a roller. Now the land is in good shape to begin work in a workmanlike manner. First lay out two roads, one across the centre, the other at right angles; now the nursery is in four parts, and ready for the seed.

It is of the greatest importance that the seed is of the very best. Last year we purchased seed from an American, as well as from some native planters. Of course, we marked the different seed, or rather the location, but, to our sorrow, that was not at all necessary, as the seed from the American planter germinated at least 95 per cent., while the other germinated about 25 per cent., and very poor plants at that. So the first thing to do is to be certain that the seed is from a reliable person, then go ahead,

Get good hard wood pegs 2 feet long, pointed at one end; now stretch your line across the upper end of one of the quarters, close to the road, which should be 4 feet wide; now with a rule measure 2 feet from the starting point, drive your peg, and so on at every 2 feet, until the whole is marked out; then go the opposite side and do the same, beginning near the centre line and running full across the same piece of the nursery, and, of course, exactly opposite to the first line of pegs. All the rest of the nursery is to be done in the same manner. Now run lines of very stout cord from peg to peg across the quarter to be planted. Open out the lines with a rake and just 1 inch deep, drop in the seed as soon after the lines are opened as it is possible, so as to save the moisture; drop in the seed just 2 inches apart, and cover at once, using the back of the rake for this operation. I have been particular in describing the work in the nursery because the nursery is the foundation of the plantation. Any slip-shod methods tolerated in the nursery will for ever show in the plantation.

I prefer to make the lines 2 feet apart for the reason that a small cultivator can be used between the lines for keeping the weeds down while the plants are very young, after they have grown 1 foot high one hand weeding will be all that is necessary. Some planters may think that 2 feet apart is not enough, but they should remember that we are not after primary branches, or secondary ones, all we want in the young rubber plant is a good straight stem. In coffee, for instance, we take the crop from the branches, but rubber is taken from the trunk of the tree; besides, all branches of the rubber fall off until the tree is at least 12 or more feet high.

The nursery, as I have said above, is the most important part of the plantation; so I will close with the promise that in my next letter I will treat on pitting digging the plants trimming, carrying to the field, distributing and planting. This latter requires great attention. For instance, we are to plant out 1,500,000 rubber plants in the coming season in a given number of days; so we have to find out how many holes a man can make in a day, how many plants a man can dig and trim in a day, how many he can carry out to the field, how many boys will be required to distribute the plants in front of the planters, and how many plants a man can properly plant in one day; this being done, the question of getting the men to do this amount of work in a given number of days has to be thought out.

Rubber planted out quick after the beginning of the rains shows up the best, and with fewer vacancies than those planted later. Of our last season's planting, those plants put out at the beginning of the rains show up very much better than those planted last, although we were only 28 days planting 340,000 plants.—Yours truly.

JAS. MAUNDER.

THREE WAYS OF FEEDING MILK TO CALVES.

Twenty head of grade Shorthorn and Hereford calves were purchased by the Kansas Experiment Station in the spring of 1900 and divided into two lots. One lot was fed on sterilized creamery skim-milk, with a grain ration composed of equal parts of corn and Kafir-corn meal, with all the alfalfa hay they would eat. The second lot was fed the same as the first, except that fresh whole milk was used instead of skim-milk. In addition to these two lots the station secured the privilege of weighing 22 head of high-grade Hereford calves which were running with their dams in a pasture near the Experiment Station.

RESULTS WITH SKIM-MILK.—For the 22 weeks under experiment the 10 calves consumed 24,736 pounds of skim-milk, 1,430 pounds of corn chop, 1,430 pounds of Kafir-corn meal, and 641 pounds of alfalfa hay. The total gain was 2,331 pounds, or a daily average of 1.51 pounds per head. Figuring skim milk at 15 cents (7½d.) per 100, grain at 50 cents (2s. 1d) per 100 pounds, and hay at $4 (16s. 8d.) per ton, the total feed cost of raising these calves was $52,68 (£10 19s. 6d.), or $5.27 (£1 1s. 11½d.) per head. The feed cost for each 100 pounds of gain was $2.26 9s. 5d.)

Cows that are milked will produce larger yields than when suckling calves. According to the average yield at this station, 10 cows (one for each calf) produced 55,540 pounds of milk, testing 3·93 per cent. butter fat. With butter fat at 15½ cents, (7¾d.) per pound, this would amount to $338.52 (£70 10s. 6d.) The value of the skim-milk not needed by the calves would raise this to $374.24 (£72. 19s. 4d.) Deduct from this the value of the feed consumed by the calves, and there remains $321.56 (£66 19s. 10d.), or $32.15 (£6 13s. 11½d. per calf to pay for the expense of milking, feedin the calves, and hauling the milk to the creamery. At 12½ cents (6¼d.) per hour this expense need not be one-half of the above sum, leaving $15 (£3 2s

6d.) to $16 (£3 6s. 8d.) clear profit for each calf raised on skim-milk.

RESULTS WITH WHOLE MILK.—During 22 weeks these 10 calves consumed 23,287 pounds of fresh milk, 8,355 pounds of corn chop, 835 pounds of Kafir-corn meal, and 835 pounds of alfalfa hay. The total gain was 2,878 pounds, or a daily average of 1·95 pounds per head. Charging butter fat at creamery prices, the feed cost of raising these calves amounts to $157.19 (£32 14s. 11½d.), or $15.72 (£3 5s. 6d.) per head. The feed cost for each 100 pounds of gain amounts to $5·46 (£1 2s. 9d).

RESULTS WITH CALVES NURSED BY THE COWS.—On May 28, 1900, 22 calves that were running with their dams averaged 174 pounds. On October 15 these same calves averaged 422 pounds, or an average daily gain per head of 1·77 pounds. The only expense attached to raising these calves was the keep of the cows, which was estimated by the owner to be $12 (£2 10s.) per head. Multiplying the average daily gain of these calves by 154, the number of days in previous experiment, gives a total gain of 272 pounds per head. With $12 (£2. 10s) as the cost of raising the calf each 150 pounds of gain cost $4.41 (18s. 4½d.)

RESULTS IN FEED LOT AFTER WEANING.—In the fall all these calves were placed in the feed lot, where they were pushed for baby beef. During the seven months under experiment the skim-milk calves gained 440 pounds per head, the whole milk calves 405 pounds per head, and the calves nursed by the cows 422 pounds per head.

This experiment shows that the feed cost of raising a good skim-milk calf need not exceed $5.25 (£ 1 1s. 10½d.), in contrast to 15.75 (£3 5s. 7½d.) for a whole-milk calf, and $8 (£1. 13s. 4d. for one nursed by the dam. The skim-milk calf becomes accustomed to eating both grain and roughness early in life, is handled enough to be gentle, and when transferred to the feed lot is ready to make rapid and economical gains. D. H. OTIS, Experiment Station, Manhattan, Kan,—*Journal of the Department of Agriculture of Western Australia.*

CULTIVATION OF SUNFLOWERS.

The first year of the twentieth century closed with a curious sale, on the Baltic, of a cargo of sunflower seeds, which changed hands at £11 5s. per ton. Though a small trade has been done in sunflower seeds for close on 200 years, this transaction was the first in which a whole cargo—300 tons from Odessa—was dealt with. In Russia, where the cultivation of the sunflower and the manufacture of oil from its seed is conducted on a large scale, the Grandi Flora is the variety grown. The species rises in a slender stalk of 5ft. high, producing one monster head, the average yield being as much as fifty bushels of seed to the acre. So rich is it in oil that that quantity of seed will yield fifty gallons of oil; while the refuse of the seed, after this quantity of oil has been expressed, weighs 1,500 lbs. when made into cattle cakes. Few people in England who grow the sunflower for ornament have any idea of its usefulness. It is among neglected crops in which there is money, as is shown by the priee paid a few days ago. Besides the seed, every other portion of the plant can be utilized. The leaves furnish an excellent fodder; while in Russia the stalks are rized as fuel, and their ashes, which contain 10 per cent. of potash, are readily sold at soapmakers Naturally, in Russia the chief virtue of the sunflower lies in oil contained in its seed. The oil is of a clear, pale yellow colour, almost inodorous and of an agreeable, mild taste, so that it is in great request as a table article. Why sunflowers are not cultivated on an extensive scale in England, it is difficult to say. Poultry and cattle like the seed either in its natural state or crushed and made into cakes. No plant produces such fine honey and wax; when the flower is in bloom the bees abound in it.—*Journal of the Department of Agriculture of Western Australia.*

PLANTING NOTES.

BUREAU OF PLANT INDUSTRY.—This is a section of the U.S. Department of Agriculture, organised in July 1901, and devoted to the investigation of vegetable physiology and pathology, botanical investigations and experiments, the study of grass and forage plants of pomology, of seed and plant introduction and other matters relating to horticulture and agriculture. Some idea of what our American kinsfolk are doing may be obtained by stating that the bureau consists of a chief, Prof. Galloway, and no fewer than twenty-five assistants, comprising pathologists, botanists, physiologists, a "cerealist," a Tobacco expert, a mycologist, and a chemist.—*Gardeners' Chronicle.*

THE ROTHAMSTED EXPERIMENTS.—The Lawes Agricultural Trust Commmittee at a recent meeting appointed Mr. A. D. Hall, M.A., principal of the Agricultural College, Wye, to succeed the late Sir HENRY GILBERT, F.R.S., as the Director of the Rothamsted Experimental Station. Principal HALL, who received his training at Oxford, and has since distinguished himself by his successful development of Wye College as a centre of agricultural education, will thus carry on the historic experiments that were jointly conducted by Sir J. B. LAWES and Sir HENRY GILBERT for over half a centry at Rothamsted, and it is anticipated that not only will the continuity of the work of the past be maintained, but that the progress of science will be advanced in new directions at this national centre of agricultural research.—*Times.*

A GIGANTIC GRASS SEED.—At the meeting of the Linnean Society on Thursday, March 20, Dr. OTTO STAPF exhibited several seeds of Melocanna bambusoides, a species of Bamboo, which completely upset the popular idea of grass seed dimensions, the giants of which are presumed to be represented by pedigree Wheat and Maize, in which latter the huge mass of seeds constitutes, it is true, a very substantial fruitage, the actual seeds, however, are comparatively small In Melocanna, on the other hand, in lieu of a spike arm or cylindrical mass of associated small seeds, we have solitary ones, measuring no less than 5 inches in height, by 3 in diameter, a massive pear-shaped body, the size and form of which are as utterly different from our usual idea of a grass seed as can well be conceived. By what evolutionary process this huge solitary fruit has been arrived at, is not clear, but as might be expected, the great store of nutriment embodied in so large a fruit favours the development of the associated embryo plant to such an extent, that the first product of germination is a robust growth, which practically secures establishment and continued existence. The single seed is thus fully as efficacious, if not more so, in securing reproduction, than a very large number of small ones, and by its greater individual vigour, would probably have an infinitely better chance of survival in a dense, growing Bamboo jungle, where small weakly seedlings would be utterly incapable of reaching the light. This, indeed, is probably the key to its genesis.—*Gardeners' Chronicle.*

TEMPLESTOWE ESTATE CO., OF CEYLON.

The following is the report of the directors, prepared for presentation to the annual meeting of this Co. in the office of Messrs J M Robertson & Co. :—

The Directers have the pleasure to submit their reports and accounts for the year ending 31st Dec 1901. The Crop amounted to 207,173 lb which was short of the Estimate by 17,827 lb. The shortage occurred during the latter half of the season when the weather was most unfavourable for flushing. 7,711 lb clean cinchona bark were also harvested.

The Tea cost 27·57 cents per lb and netted 38·11 cents, (including tea unsold but estimated) against 37 cents last year, which is not unsatisfactory, considering the low prices ruling for the period under review. The Superintendent deserves much credit for the way in which he has worked the Estate and kept the tea up to a very steady standard of quality.

The Acreage of the Estate now consists of : —

479½	acres	Tea 5 years old and upwards.	
14¾	do	4	do
70½	do	3	do
6	do	2	do
110	do	Forest.	do
342¼	do	Chena and Patna.	
1023			

The profit on the year's working amounts to R18,033·30 including the balance brought forward from last season and after paying interest on the loan of £4,500. Out of this an interim dividend of 3 per cent has been paid on the Preference Shares, absorbing R3,258 and the amount available for distribution is therefore R14,775·30.

The Directors recommend that this sum be disposed of as follows :—

By the payment of a final Dividend of 3 per cent on the Preference Shares, absorbing	R3,258·00
By the payment of a Dividend of 3 per cent on the Ordinary Shares, absorbing	R4,926·00
By transferring to Depreciation account	R5,000·00
By carrying forward the balance of	R1,591·30
	R14,775·30

Mr H G Bois, who was appointed a Director in place of Mr F W Bois who has left the island, retires in accordance with the Articles of Association but, being eligible, offers himself for re-election.

It will also be necessary to appoint an Auditor for 1902.

KANDYAN HILLS COMPANY, LIMITED.

THE REPORT.

ACREAGE STATEMENT.

Tea in full bearing ...	410 acres
Not in full bearing under one year	23 ,,
Cocoa	90 ,,
Reserve and Forest Land ...	787 ,,
Total ...	1,310 acres

The Directors beg to present their Report for the season ended 31st December, 1901, together with a statement of the accounts, duly audited, for the same period.

The Tea Crop secured, including bought leaf and Tea made for others, amounted to 200,858 lb. The Cocoa Crop amounted to cwts. 131-1-25 and Croton Seed cwts. 2-3-14. The made Tea gathered from the Estate itself was 175,200, as against an estimate of 200,000 lb. whilst the bought leaf represented 1,600 lb and Tea made for others 24,103 lb, making the total of 200,858 lb.

The total cost of production, including Manuring, was 25·20 cts. per lb. made Tea.

The surplus at credit of Working account represents R11,261·59 which, together with R1,414·38 brought forward from Crop season 1900, makes a total of R12,675·97. After paying Interest and other charges and providing a sum of R3,000 for depreciation, there remains a balance of R208·82, which the Directors recommend should be carried forward to the new year.

The new season's estimate of Expenditure is based on a Crop of 200,000 lb. of made Tea at a cost of 22·92 per lb. (including R3,160 to be spent on manuring) and 130 cwts. Cocoa costing R3,760.

Mr. A Collingwood Smail, who has taken up the visiting of the Company from the commencement of this season, in his report dated 18th February, writes hopefully of prospects. Pruning during 1902 is well distributed, which should prevent the Factory at times being overcrowded, and therefore tend to the making of a better and more uniform style, the latter a matter to be aimed at with Tea at this elevation. Mr. Smail also mentions that he hopes there will be a saving on the estimated cost of production.

Mr. W Shakspeare retires from the Board by rotation, but is eligible for re-election.

The appointment of an Auditor rests with the meeting.

YATIYANTOTA, CEYLON TEA COMPANY, LIMITED.

DIRECTORS.—A Thomson Esq., Chairman, Charles Young Esq., J M Skinner Esq.

MANAGING AGENTS.—Messrs. Whittall & Company, Colombo.

SECRETARY AND OFFICERS.—T. A. Williams, 27, Mincing Lane, London, E.C.

REPORT OF THE DIRECTORS

The following is a comparative statement of the past three years' working:—

Year.	Average Plucked mature and in partial bearing.	Crop secured from Company's Estates.	Average yield per acre plucked.	Average Rate of Exchange per Rupee.	Cost of Crop per lb.	Net Average Sale Price per lb.
		lb.	lb.			
1899	2,376	1,343,387	565	1s 4 5-16d	3·48d	5·68d
1900	2,854	1,470,590	515	1s 4 7-32d	3·40d	4·56d
1901	2,970	1,261,484	425	1s 4 7-32d	3·83d	5·10d

to be submitted at the fifth annual general meeting of shareholders to be held at the London Commercial Sale Rooms, 30 to 34, Mincing Lane, London, E.C, on Thursday, the 10th April, 1902, at 12 noon.

The Directors now beg to submit the duly audited accounts of the Company for the year ended 31st December, 1901, and they regret being unable to place before the Shareholders a more satisfactory statement.

The bearing area, of all ages, was 2,970 acres from which crops amounting to 1,261,484 lb. were secured, and, in addition, 4,338 lb. were made from purchased leaf. Of the total, 626,087 lb. were sold in Colombo, and 639,735 lb. were shipped to London, the net average realised for the whole being 5·10d per lb.

Including purchased leaf, the average cost, f o b (or delivered to buyers in Colombo), was 3·83d per lb. The average rate of exchange for the year was 1s 4 7-32d per rupee.

The Crop of last year was much smaller than that of 1900, due partly to an alteration in the system of plucking, and partly to the season having been a less forcing one. As a result the Teas produced have shown considerable improvement in quality, but, owing to excessive stocks of Tea in bond in London, the increase in the average price secured has not

been commensurate with the improvement in quality. A further extent of young Tea came into the plucking area during the past year; all young and weak fields have been very lightly treated, and this has contributed to the lowering of the average yield per bearing acre.

The net profit for the year amounts to		£5,962 3 8
To which has to be added balance from 1900 Account..	£2,349 15 3	
Less Bad Debt (Ceylon) now written off ..	289 13 6	
		2,060 1 9
Together ..		8,022 5 5
Dividends have been paid as follows:— On the Preference Shares at 6 per cent per annum— On 1st July, 1901, and 1st January, 1902 ..		2,700 0 0
Leaving now to be dealt with ...		£5,322 5 5
This the Directors propose to appropriate as follows:—		
(1) In payment of a Dividend on the ordinary shares of 2½ per cent (free of Income Tax) for the year 1901 ..	2,250 0 0	
(2) In writing off Cost of Properties, including Depreciation of Machinery and Buildings ...	1,000 0 0	
(3) In carrying forward to 1902 the balance of ..	2,0725 0	
		£5,322 5 5

The following are details of the acreage of the different properties as on 1st January, 1902:—

ACREAGE UNDER TEA.

Estate.	Bearing.	Partial Bearing.	Not Bearing.	Total.	Forest Reserves, &c.	Total Acreage.
Polatagama ..	791	—	50	841	201	1,042
Weoya and New Polatagama ..	632	95	—	727	345	1,072
Walpola ...	871	—	—	871	145	1,016
Rondura ...	506	87	8	601	629	1,230
	2,800	182	58	3,040	1,320	4,360

The Company's properties are well equipped with buildings and machinery, and are generally in good heart and condition. The Directors trust, in view of the steadily increasing demand for British-grown teas, that a return to a profitable level of market values may soon be experienced. Mr W J Smith having retired from the Board, the Directors appointed Mr John McInnes Skinner to fill the vacancy, and the appointment will be submitted for confirmation by the Shareholders. In terms of the Articles of Association, Mr A Thomson retires from the Board, and, being eligible, offers himself for re-election. Messrs. Cape and Dalgleish, C A, offer themselves for re-election as Auditors of the Company.—By order of the Board, T. A. WILLIAMS, Secretary.

27, Mincing Lane, London, E.C., 2nd April, 1902.

GENERAL CEYLON TEA ESTATES, LIMITED.

REPORT OF THE DIRECTORS

and accounts to December 31st, 1901, to be submitted at the 5th annual general meeting of shareholders, to be held at Cannon Street Hotel on Monday, the 14th April, 1902, at 12 o'clock noon.

The Directors beg to submit herewith the accounts of the Company and their report for the year ending December 31st 1901, showing a profit of £11,737 8s 0d.

After allowance for debenture interest and other charges, there remains a sum of £3,717 15s 11d at the credit of profit and loss, to which has been added a balance of £493 3s 11d brought forward from the previous year, making a total of £4,210 19s 10d out of which the Directors have written off a sum of £2,000 on account of depreciation of plant and machinery and propose to carry forward the balance of £2,210 19s 10d.

The crops from the Company's estates amounted to 2,371,738 lb. Tea, exclusive of bought leaf, against an estimate of 2,614,000 lb tea, 2,133 bushels of coffee, and 262 cwt. of cocoa.

The tea cost, sold in London, 5·03d., and realised 6·04d. per lb. The exchange for the year averaged 1s. 4 17-64d.

The yield per acre was 433 lb over the fields in full bearing, after allowing 200 lb per acre for the partial bearing fields.

The present cultivated acreage is as follows:—

Tea in bearing	...	5,139	Acres.
Tea in partial bearing	..	297	do
Not in bearing	..	163	do
Cocoa	..	126	do
Coffee	...	118	do
Total cultivated area		5,843	Acres.

The decrease in the expenditure, as compared with the previous season, is largely due to the temporary suspension of manuring operations for a portion of the year.

The position of affairs during the year decided the Directors that this curtailing of expenditure was prudent, but they are satisfied that manuring can now be resumed.

The statistical position of the tea industry has become sounder during the year, but the present level of prices is still unsatisfactory.

Mr James Sinclair, the Director retiring by rotation, being eligible, offers himself for re-election.

Messrs Boards, Paterson & Co., the Auditors to the Company, retire, and, being eligible, offer themselves for re-election.

NAHALMA TEA ESTATE CO., LTD

REPORT OF THE DIRECTORS

to be presented to the shareholders at the eighth annual ordinary general meeting to be held on Wednesday, 9th April, 1902, at the office of the Company, 39, Victoria Street, Westminster, at 12 o'clock noon.

The Directors beg to submit their report, together with the general balance sheet and profit and loss account, for the twelve months ending 31st December, 1901, duly audited with results, before paying debenture interest, interest on deposits, and Directors' fees, in a profit of (after making provision for bad debts incurred on estate prior to 1st October, 1901) £29 13s 1d. But after allowing for—interest of various instalments on prior line 6 per cent., Mortgage debentures from dates of payment to 31st December last, not payable till 30th June, 1902, £23 8s 4d.; debenture interest to 31st December, 1901 (not paid) £540; interest on deposit loans (not paid) £18 17s 4d; Directors' fees (not paid) £100; debit balance from 1900, £423 19s 1d there will be a balance at debit of profit and loss account to be carried forward to next year of £1,076 11s 8d.=£1,106 4s 9d.

The crop obtained was 185,268 lb, as against an estimate of 266,000 lb. The shortage was due in a measure to climatic conditions prevailing generally throughout the Kelani Valley.

The acreage of the Company's properties on 31st December last remained unaltered, at—tea in full bearing, 446 acres; jungle, 246 acres; total 692 acres.

A change in the superintendents of the estate was made on 1st October last, since which date the estate

has shown better results, which the Directors confidently hope will be continued.

The crop for the season 1902 is estimated at 210,000 lb.

Mr John Abernethy, the Director, retiring by rotation, being eligible, offers himself for re-election.

Messrs. Fox Sissons & Co., Auditors to the Company, offer themselves for re-election.

PANAWAL TEA COMPANY, LIMITED.

REPORT OF THE DIRECTORS

to be presented to the shareholders at the tenth annual ordinary general meeting, to be held on Tuesday, 8th April, 1902, at the office of the Company, 39, Victoria Street, Westminster, S W.

The Directors beg to submit the general balance sheet and profit and loss account for the year ending 31st December, 1901, duly audited :—The net amount at credit of profit and loss account, including balance brought forward at 31st December, 1900, after providing for general expenses, Directors' and Auditors' fees £943 13s 10d. Dividends on the 7 per cent. cumulative preference shares were paid for 1901, in full, amounting to £371. It is proposed to pay a dividend of 3 per cent on the ordinary shares for the year ending 31st December, 1901, free of income tax, which will absorb £510. Leaving a balance to be carried forward to next season of £62 13s 10d.—Total £943 13s 10d.

The Directors recommend the distribution of a dividend at the rate of 3 per cent. on the ordinary shares of the Company for the year ending 31st December, 1901.

The Directors have still to report upon the very unsatisfactory state of the tea growing industry. Prices during the early part of the season were abnormally low, and the rise that took place later appears only to have stimulated free plucking where possible, and this has tended to reduce prices again later.

No alteration has taken place during the last twelve months in the acreage of the Company's properties, which stood :—

On 31st December last.	
Tea in full bearing ...	590
Jungle ..	341½
	931½ Acres.

The weather during the season was against free growth in the Kelani Valley. The crop realized for 1901 was 273,322 lb. as against an estimate of 335,000 lb, and a revised estimate of 295,000 lb. The yield in 1900 was 339,550 lb.

The visiting Agent (Mr F J Clements) reported the properties at the date of his last visit as being in satisfactory order.

The Honourable Norman Macleod Sinclair, the Director, retiring by rotation, being eligible, offers himself for re-election.

Messrs. Fox, Sissons & Co., Auditors to the Company, offer themselves for re-election.

TYSPANE TEA COMPANY, LTD.

The Directors have the pleasure to submit the Balance Sheet and Accounts of the Company for the year ending 31st December 1901, duly audited.

The total yield was 277,773 lb. Tea against 280,000 lb. estimated and 252,373 lb. obtained last year, and in view of the generally unfavourable season this may be considered satisfactory.

The average price realised per lb. Tea was 5.66d. nett against 5.72d. nett last year.

The expenditure includes the cost of new machinery about £440, and upkeep of new clearings about £142, charged against revenue. The factory is now fully equipped, and for some time to come only repairs should be necessary.

The present season's crop is estimated at 285,000 lb, Tea.

Exchange averaged 1s 4¼d per rupee against 1s4 5·16d last year.

The Net Profit for the year, after payment of the Interest on Debentures, is ..	£986 10 4	
To which has to be added the balance brought forward from last year of ...	176 7 3	
		£1,162 17 7
The Directors have already paid out of this an Interim Dividend of 2 per cent., free of Income Tax ...	360 0 0	
Income Tax ..	60 7 9	
And it is proposed :—		
To pay a final Dividend of 4 per cent. free of Income Tax, making 6 per cent. for the year	720 0 0	
And to carry forward ..	22 9 10	
		£1,162 17 7

Mr. Edward Dumaresq Thomas, the retiring Director, offers himself for re-election.

The Auditor, Mr. J Hamilton Alston, also offers himself for re-election.

The acreage of the Estates is as follows:—

Tea in bearing		693	acres.
Tea in partial bearing		47	do.
Tea planted in	1897	10	do.
Do	1898	28	do.
Do	1899	4	do.
Do	1901	18	do.
Jungle, Timber, Waste, &c.		168	do.
		968	acres.

AUGUSTA TEA ESTATES CO., LTD.

FIFTH ANNUAL REPORT.

The Directors beg to submit the Audited Accounts for the year closing 31st December, 1901.

The quantity of tea manufactured has been 125,971 lb, which has brought an average price of 6·36d per lb. gross, the cost of production having been 23·12 cents., or equivalent to about 4½d per lb. in London. The average rate of exchange has been 1s 4 11-32d.

The result of the year's working has been satisfactory, and the Directors are able to write off an adequate amount for depreciation.

The profit and loss account shows that, after writing off £232 10s from Factory and Machinery account, there is left a sum of £225 11s 7d at credit, and out of this the preference dividend for the year has been paid and the balance carried forward to next account.

By the Articles of Association, Mr Edward H Hancock retires and, being eligible, offers himself for re-election.

The Auditors, Messrs Singleton, Fabian & Co., also offer themselves for re-election.

CHARLES A. REISS and THOMAS J. LAWRENCE, Directors, ALBIN B. TOMKINS, Secretary.

London, 17th March, 1902.

LINDULA TEA COMPANY, LTD.

The Directors have the pleasure to submit the balance sheet and accounts of the Company for the year ending 31st December, 1901, duly audited.

The total crop was 171,311 lb. tea, against 185,000 lb. estimated, and 185,634 lb. obtained last season. The falling-off in yield is chiefly attributable to the unfavorable flushing weather during the latter half of the year. The crop was at the rate of 535 lb. per acre, and cost 27 cents per lb., free on board at Colombo, and the gross average price of the 166,050 lb. sold in London was 8¼d against 8½d for 174,820 lb sold last year. The current season's estimate is 175,000 lb, tea.

Drafts were negotiated at an average rate of 1s 4¼d against 1s 4 9-32d last year.

The Nett Profit for the year amounts to ..	£1,722 18 9	
And the Balance from last year to ..	217 0 10	
Making a total of ..		£1,939 19 7
The Directors have already paid out of this, Dividends on the 6 per cent Preference Shares for the year ending 31st Dec., 1901	£780 0 0	
Interim Dividend on the Ordinary Shares of 2½ per cent free of Income Tax ..	650 0 0	
Income Tax ..	83 12 10	
And it is Proposed:—		
To pay a Final Dividend of 1½ per cent free of Income Tax on the Ordinary Shares, making 4 per cent for the year ..	390 0 0	
And to carry forward the balance of ..	36 6 9	
		£1,939 19 7

The Director retiring on this occasion is Mr Edward Dumaresq Thomas, and, being eligible, he offers himself for re-election.

The Auditor, Mr J Hamilton Alston, also offers himself for re-election.—By Order of the Board,

ROBERTSON, BOIS & CO., Agents and Secretaries.

GENERAL CEYLON TEA ESTATES, LIMITED.

The following is from the report of directors, to be submitted at the fifth annual general meeting of shareholders, to be held on Monday next :—

The directors beg to submit herewith the accounts of the company and their report for the year ending December 31, 1901, showing a profit of £11,737 8s. After allowance for debenture interest and other charges, there remains a sum of £3,717 15s 11d at the credit of profit and loss, to which has been added a balance of £493 3s 11d brought forward from the previous year, making a total of £4,210 19s 10d, out of which the directors have written off a sum of £2,000 on account of depreciation of plant and machinery, and propose to carry forward the balance of £2,210 19s 10d. The crops from the company's estates amounted to 2,371,738 lb tea, exclusive of bought leaf, against an estimate of 2,614,000 lb tea, 2,133 bushels of coffee, and 262 cwt of cocoa. The tea cost, sold in London, 5·03d, and realised 6·04d per lb. The exchange for the year averaged 1s 4 17 64d. The yield per acre was 433 lb over the fields in full bearing, after allowing 200 lb per acre for the partially bearing fields. The present cultivated acreage is as follows: Tea in bearing, 5,139; tea in partial bearing, 297; not in bearing, 163; cocoa, 126; coffee, 118; total cultivated area, 5,843 acres. The decrease in the expenditure, as compared with the previous season, is largely due to the temporary suspension of manuring operations for a portion of the year. The position of affairs during the year decided the directors that this curtailing of expenditure was prudent, but they are satisfied that manuring can now be resumed. The statistical position of the tea industry has become sounder during the year, but the present level of prices is still unsatisfactory. Mr James Sinclair, the director retiring by rotation, being eligible, offers himself for re-election.—*H. and C. Mail*, April 11th.

STANDARD TEA COMPANY OF CEYLON, LIMITED.

The following is from the eleventh report of the directors to the shareholders, to be submitted at the general meeting, to be held on Wednesday, 23rd inst :—

The directors submit statement of accounts to December 31, 1901. The profit and loss account shows a profit on the working of the estates in Ceylon of £10,980 19s 8d, which, with the amount brought forward from last year, less interest and home charges, shows a sum of £10,183 11s 8d available for division. In August, 1901, the directors, under the powers entrusted to them, distributed an interim dividend for the six months ending June 30, 1901, of 5 per cent. (10 per cent per annum), absorbing £2,975. They now recommend a dividend at the rate of 10 per cent (making 15 per cent for the year) absorbing £5,950; and the carrying forward to the next year £1,258 11s 8d. The coffee crop was 24cwt; it realised about £95. The tea crop was 1,105,996 lb, against 1,129,753 lb in 1900. The average exchange for the company as drawers in Colombo was 1s 4 5-32d, against 1s 4 7-32d in 1900, and 1s 4 9 32d in 1899. Prices for Ceylon teas were again generally lower this last season. Of the company's teas produced during 1901, those from the St Leonard's factory sold at about 1¼d per lb lower price than 1900 teas; those from Gordon, 1d per lb lower; those from Gouravilla, at about the same average price. The company's properties at the close of 1901 were 3,466 acres, with 2,188 acres of tea considered in full bearing, viz:—In Uda Pussellawa—St Leonards and Coneygar, 902 acres, 530 acres tea bearing; Liddesdale, 814 acres, 200 acres tea bearing; Eskdale, 240 acres, 227 acres tea bearing; Gordon, 386 acres, 304 acres tea bearing; Tulloes, 419 acres, 275 acres tea bearing; in Up. Maskeliya—Gourawilla and Up. Cruden, 705 acres, 652 acres tea bearing. There are also 293 acres tea in partial bearing, and some 28 acres in addition planted with tea. Mr Norman W Grieve, the Director, who retires by rotation, being eligible, offers himself for re-election.—*H & C Mail*, April 11.

BALMORAL (CEYLON) ESTATES COMPANY, LTD.

The Directors have the pleasure to submit the balance sheet and accounts of the Company for the year ending 31st December, 1901, duly audited.

The total yield of tea was 595,197 lb., against 563,556 lb. last year, being at the rate of 616 lb. per acre all round; the cost of production, exclusive of capital expenditure, was 24½ cents per lb., free on board at Colombo, and the Gross average price obtained was 8.53d per lb, against 8.86d per lb. last year—Sandringham teas averaging 8.28d, and Clydesdale 8.78d per lb. Exchange have averaged throughout the year 1s 4 3-16d against 1s 4¼d last year.

Two Oil Engines have been erected in the Clydesdale Factory, and the cost of them, £498 3s 4d., is charged to capital account. All other expenditure having been charged against revenue, the Directors do not consider it necessary to set aside any specific sum for depreciation.

The Net Profit for the year amounts to ..	£7,782	4	2			
And the Balance from last year to ..	722	17	4			
Making a total of ..				£8,505	1	6
The Directors have already paid out of this, Dividends on the 6 per cent Preference Shares for the year ending 31st December, 1900 ..	£1,800	0	0			
Interim Dividend on the Ordinary Shares of 5 per cent free of Income Tax ..	2,601	15	0			
Income Tax ..	305	14	0			
And it is proposed :— To pay a Dividend of 6 per cent free of Income Tax on the Ordinary Shares, making 11 per cent for the year ..	3,122	2	0			
And to carry forward the balance of ...	675	10	6			
				£8,505	1	6

The Auditor, Mr J Hamilton Alston, offers himself for re-election.

EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

REPORT.

To be presented at the Fifteenth Ordinary General Meeting, to be held at Winchester House, Old Broad Street, at 12 o'clock noon, on the 30th April, 1902.

The Directors submit Report and Balance Sheet for the year ending 31st December, 1901.

The profit for the year is £20,439 9s 2d, which, added to £7,242 6s 9d, balance from last account, amounts to £27,681 15 11.

From this has to be deducted :—Interest on Debentures £3,600 ; Debentures for £7,500 drawn and paid off, with bonus of 6 per cent, on 31st December, 1901, £7,875 ; Interim Dividends of 2½ per cent. on Preferred and 1½ per cent. on Ordinary Share Capital, paid 4th November, 1901, £3,746 19s.—Total £15,221 19s; Leaving a balance of £12,459 16s 11d, which it is proposed to apportion as follows:—Final Dividends on the Preferred Shares of 2½ per cent, making 5 per cent for the year, and on the Ordinary Shares of 1¾ per cent, making 3 per cent, for the year £5,238 4d; Balance to be carried forward as provision for retirement of Debentures in the current year £7,221 12s 11d.—Grand Total £12,459 16s 11d.

The Debenture debt which stood on 31st December, 1900, at £80,000, has been reduced by the payment of £7,500 out of profits, and now stand at £72,500.

As shown in the schedule below, the Company on 31st December last, had 11,028 acres under Tea cultivation, of which 10,491 were over four years old.

The yield of Tea in 1901 was 3,830,383 lb, the average gross sale price being 6·61*d*., as compared with 6·51*d*. in 1900. The short yield as compared with the previous year is due to the unfavourable weather that generally prevailed combined with a more careful system of plucking. The enhanced price obtained for the 1901 crop may be considered satisfactory in view of the fact that the Ceylon average price shows no improvement on the corresponding period for 1900.

The average rate of exchange was 1s. 4 11-32d., as compared with 1s. 4 7-16d. in 1900.

Accompanying this Report will be found a copy of Special Resolutions to be proposed at an Extraordinary General Meeting to be held at the close of the General Meeting on the 30th instant. It will be remembered that the formation of this Company was of an exceptional character, and the Articles of Association did not include all the powers usually inserted. It is now considered desirable to supply this omission so that the Directors may be free to act as and when called upon in the interests of the Company in relation to the matters indicated in the Resolutions in question.

In accordance with the Articles of Association, two of the Directors, Mr. R. A. Cameron and Mr G A Talbot, retires from office, and, being eligible, offer themselves for re-election.

The retiring Auditors, Messrs Welton Jones & Co., offer themselves for re-election. RALPH A CAMERON, Chairman and Managing Director.

41, Eastcheap, E.C., 11th April 1902.

SCHEDULE OF THE COMPANY'S ESTATES AT 31ST DEC. 1901.

Arapolakande, Asgeria and Bulatwatte, Colonna, Condegalla, Doombagastalawa, Dromoland, Hope, Ingurugalla and Berrewella, Kirrimettia, Kumaradola, Kubukkan, Labookellie, Meddecoombra, Norwood, Rothschild, Sogama, Vellai oya and Dandukelawa and Wevekellie.

Under Tea.—11,028 acres ; Cacoa 593 acres ; Cardamoms, Cinchona, Rubber and Sundries 327 acres; Forest, Grass and uncultivated Land 4,642 acres.—Total 16,590 acres.

CEYLON TEA PLANTATIONS CO., LTD.

Report of the Directors to be submitted at the Fifteenth Annual Ordinary General Meeting of Shareholders, to be held at the office of the Company on Monday, 28th April, 1902.

The Directors have the pleasure to submit the general balance sheet and profit and loss account for the year ending 31st December, 1901, duly audited.

	£	s.	d.	£	s.	d.
The net amount at credit of Profit and Loss Account, including Balance brought forward at 31st December, 1900, and after providing for General Expenses, Directors' Fees, Income Tax, &c., is ..				44,044	11	6
Dividends on the 7 per cent Preference Shares were paid for 1901 (less Income Tax) amounting to ...	5,356	7	3			
An Interim Dividend of 7 per cent on the Ordinary Shares was paid 29th October, 1901, amounting to..	11,716	12	0			
It is proposed to pay a final Dividend of 8 per cent on the Ordinary Shares (making 15 per cent in all, free of Income Tax) which will absorb ..	13,390	8	0			
To write off for Depreciation ..	5,000	0	0			
And to carry forward to next year a balance of ..	8,581	4	3			
				£44,044	11	6

The unfavorable condition of affairs in the Tea-Growing industry, which had to be recorded for the year 1900, was, your Directors regret to say, continued during the past year.

It is, however, a matter for satisfaction that the profits of the Company enable the Directors to recommend the payment of a dividend of 15 per cent, free of income tax, for the fifteenth consecutive year to the ordinary shareholders; to set aside £5,000 for Depreciation, and to carry forward the sum of £8,581 4s 3d,

Owing to finer plucking on some of our estates, but mainly due to most unfavorable weather, the crop from the Company's tea proprietors showed a diminution of yield per acre of 12 per cent as compared with the previous year, the output being 463 lb. per acre as against 526 lb in 1900.

The following shows the quantity of tea accounted for in the profit and loss statement :—

Estate Tea.	Bought Leaf Tea	Manufactured for others.	Total.
lb.	lb.	lb.	lb.
3,957,335	421,960	301,445	4,680,740

The average gross price for the tea sold in London and elsewhere, including bought leaf, was 7·41d per lb. compared with 7·15d the previous year, and the rate of exchange 1/4 15-64 as against 1/4 19-64 in 1900.

The coconut crop was 1,401,768 nuts. Owing to the improved state of the market, and the favourable condition of the properties for an increasing yield, the future prospects are encouraging for this product.

The year under review has been a trying one for those working tea properties in Ceylon, and the services of the Company's Staff deserve the appreciation of the Shareholders for the results obtained.

Under Clause No. 69 of the Articles of Association, Mr. H K Rutherford retires on this occasion from the Board and, being eligible, offers himself for re-election.

The Auditors, Messrs. Harper Brothers, Chartered Accountants, also retire from office, and offer themselves for re-election.—By order of the Board,

Wm. Johnston, Secretary.

London, 19th April 1902,

VELLIKELLIE TEA COMPANY OF CEYLON, LTD.

Your Directors have the pleasure to submit their Report and Balance-sheet for the year ending 31st December, 1901, duly audited.

The crop amounted to 275,549 lb tea, which cost 26·90 cents per lb free on board at Colombo, and the average price obtained for the 251,699 lb sold in London was 8.03 per lb. Last year the crop amounted to 233,785 lbs, costing 29.95 cents per lb f.o.b., and the average price for the 209,880 lb sold in London was 9½d per lb. The crop for 1902 is estimated at 280,000 lb tea.

Owing to the fall in the price obtained for the tea, it will be seen that, in spite of the increased yield, the profits are much the same as last year, and the Directors recommend the payment of the same dividend.

An installation of fans in the factory is now complete, and the cost of this, some £207, has been charged against the current season's expenditure.

The rate at which Drafts were negotiated was 1s 4 3-16d, against 1s 4¼d per rupee last year.

The Net Profit for the year amounts to ...	2,241 10 6	
And the Balance from last year to ...	108 13 4	
Making a total of ...		2,350 3 10
The Directors have already paid out of this. dividends on the 6% Preference shares for the year ending 31st December, 1900 ..	£285 0 0	
Interim Dividend on the ordinary shares of 3 % free of income tax ..	1,057 10 0	
Income tax	89 4 8	
And it is Proposed :—		
To pay a Final Dividend of 2% free of Income Tax on the Ordinary Shares, making 5% for the year	705 0 0	
And to carry forward the balance of ...	213 9 2	
		2,350 3 10

The Director retiring on this occasion is Mr. Percy Lawrence Johnson, and, being eligible, he offers himself for re-election.

The Auditor, Mr. J Hamilton Alston, also offers himself for re-election.

NUWARA ELIYA TEA ESTATES COMPANY, LIMITED.

Report of the Directors—to be presented to the sixth annual general meeting of shareholders, to be held on Wednesday, the 30th day of April, 1902, at Winchester House, Old Broad Street, London, E.C., at 12 o'clock noon.

The Directors beg to submit the duly Audited Accounts of the Company to 31st December, 1901.

The Crop Account shows a profit from the working of the Estates of £15,297 4s 1d.

The Profit and Loss Account, including the sum brought forward from last year, and the payment of Debenture Interest, Income Tax, &c., shows a credit of £15,791 11s 6d, from which £2 000 has been written off as Depreciation, leaving available for distribution £13,791 11 6

An Interim Dividend of 3 per cent, free of Income Tax, was paid on 23rd October, 1901, absorbing ...	£6,000 0 0	
It is now proposed to pay a final dividend of 3 per cent, free of Income Tax, making 6 per cent for the year, which will absorb a further ...	6,000 0 0	
		12,000 0 0
And to carry forward the balance of ...		£1,791 11 6

The Directors regret the falling-off in returns as compared with last season, in view of which they have considered it unnecessary to charge against the past year's profits the Capital Account outlay on additions to buildings and machinery, but ample provision for depreciation has been charged in the accounts.

The Crop of Tea from the Company's Estates was 1,225,614 lbs., as compared with 1,458,911 lbs. in 1900. The shortfall is attributable partly to less favourable weather, and partly to the adoption of a system of finer plucking, resulting in enhanced cost of production.

The average rate of Exchange for the year was 1s. 4¼d. per Rupee, and the cost of the crop, free on board steamer, or delivered to buyers in Colombo, was 5·53d. per lb. The average nett price realized was 8·48d., as against 8·66d. in 1900.

The following table shows the results of the working of the different Estates for the past year :—

Estate.	Acreage in bearing in 1901. Full.	Partial.	Tea Crop. lbs.	Average yield per bearing acre. lbs.	Nett price realized per lb. Tea. d.	Profit per bearing acre. £	s.	d.
Park ..	242	22	147,852	560	8·45	7	16	7
Portswood..	322	30	186,790	530	7·95	4	6	1
Naseby ..	176	20	97,964	500	9·13	6	10	1
Pedro ..	370	118	261,223	535	8·44	7	4	5
Concordia..	288	152	198,395	440	9·05	6	18	3
Court Lodge	366	—	155,264	424	8·47	5	19	2
Hethersett	375	25	178,126	445	8·16	4	7	7
	2,139	367	1,225,614	485	8·48	£6	2	1

The yield from Tea in full bearing was 532 lb per acre, and that from Tea in partial bearing 262 lb per acre, as compared with 644 lb and 371 lb respectively in the previous year.

As on 1st January, 1902, the acreages of the Company's properties stand as under :—

Tea in full bearing ..	2,132	
do do leased lands ..	98	
do partial bearing ..	350	
do not yet in bearing ...	22	
Total land under cultivation with Tea		2,602
Jungle, Patna and Scrub, and Fuel Trees, &c.		440
		3,042

The Estates continue in excellent condition as regards cultivation, and the Directors are satisfied with the general working of the properties during the past year.

The retiring Directors are Mr. C A W Cameron and Mr H St. J O Thompson, who, being eligible, offer themselves for re-election.

Messrs. Cooper Brothers & Co., Chartered Accountants, offer themselves for re-election as Auditors of the Company.—By order of the Directors,

FRITH, SANDS & Co., Secretaries.

London, 18th April, 1902.

PRODUCE AND PLANTING.

THE TENSION AS REGARDS THE BUDGET is over, and so far as tea is concerned producers have reason to be thankful. Not only has the Chancellor of the Exchequer declined to avail himself of Sir Robert Giffen's hint, by abstaining from adding to the duty, but he has expressed himself in terms of sympathy with tea planters. His reference to tea will be very acceptable. He said, in the course of his speech on Monday night: "Then, Sir, I come to tea. Well, I have listened to the pitiful cry of our fellow-subjects, the tea-producers in India and Ceylon, and, bearing in mind that tea, which is almost a necessary of life (hear, hear), is already taxed to as much as 75 per cent of its average value, I confess I should be sorry to increase that tax." This is all that could be desired under the exceptional circumstances, for no reduction on the duty was to be looked for, and it is something to the good to learn that, at a time when so much money has to be raised, the Chancellor of the Exchequer admits that tea is a "necessary of life," and that he would be sorry to tax an article of produce already bearing an impost equal to 75 per cent of its average value.

TEA-GROWING OPERATIONS IN SOUTH CAROLINA continue to excite a great deal of interest. The British Consul at Charleston makes reference in his annual report to the experiments in tea culture at the South Carolina Government tea farm. While it is probable, he says, that these experiments will be carried on for several years more, with different qualities under widely differing conditions, the most important facts relative to American tea culture have already been demonstrated. Among other things it has been proved that a number of kinds of tea from different countries—Japan, China, Siam, and Formosa—can be grown with profit, and that several other varieties have been found unprofitable in a commercial way. Future experiments will probably continue along this line with a view of getting the greatest productiveness from the tea plant in the shortest time. Another important point ascertained is that the tea bush can survive very cold weather. While it is undoubtedly better that it should be grown where the mercury does not go below 25 deg. Fahr., yet in the frost of two winters ago the tea gardens were subjected to a temperature below zero and suffered little injury therefrom. In the East, where tea grows naturally, the rainfall is from two to three times as much as in Carolina during the summer, which deficiency has been compensated for in the Carolina gardens by a system of irrigation. The careful labour needed in picking the delicate leaf has been provided by giving special school advantages to all the little negroes living in the vicinity who are willing to avail themselves of them, and these children are, during school hours, instructed in tea-picking, and during the tea-

gathering season they are given remunerative work. The most common objection that has been raised to the establishment of an American tea industry has been the difference in the price of labour in America and in the East, but with a full appreciation of its force as applied to poorer grades, there seems to exist a good profit in the production of those higher grades in whose cultivation cheap labour plays a minor part. And in addition the home tea production has this further advantage, that the final drying of the leaf need not be carried to the same extreme degree of heat, whereby a sacrifice of much that is agreeable and beneficial in the flavour is entailed. As we have pointed out before, and as the British Consul thinks possible, if the American Government were to place an import duty on tea, and the home-grown tea industry were to make rapid progress when so fostered, the Indian and Ceylon tea imports to the United States would be affected ; but that is in the far future. Meantime we learn from New York that with the passage of the War Tax Repeal Bill the tea market shows signs of renewed activity, and in favour of this it may be noted that the stock of tea is small.—*H. and C. Mail*, April 18.

MOSQUITOES AND MALARIA IN ITALY.

A CONSULAR REPORT.

The British Consul remarks in his Report on the Trade for South Italy for 1901 :—

The subject of mosquitoes and malaria, which was mentioned in the Report from this Consulate (No. 2,550, Annual Series), is still attracting considerable attention in Italy, and more especially in this District where a large area is subject to malaria. Next to Sardinia, the Province of Basilicata is the largest malarious tract in Italy, and therefore the most interested in the extermination of the disease. The most fatal season occurs in the months of August and September, but the further we go South the longer does the dangerous season continue, so that in Basilicata security can rarely be enjoyed or reckoned upon until the month of October is past.

MOSQUITOES GO BY TRAIN.

Mosquitoes dislike wind and when it is high they take refuge where they can. Hence they are not transported by wind as has been often supposed but they move from place to place on or about men and animals and any baggage which attracts them, a fact which explains isolated cases and epidemics which have occurred in places distant alike from marshes and stagnant water. Some interesting cases of fever, owing to this cause, occurred at the station of Termini near Rome, the cases having probably originated from mosquitoes conveyed by the Terracina train which crosses the most deadly part of the Pontine marshes.

AN ANILINE DYE EFFICACIOUS.

There is a special aniline dye which when diluted, even to the extent of 0·00031 per mile, is said to kill the larvæ. The well-known pastilles and powder, similar to ordinary insect powder, which can either be burnt or distributed by means of bellows, may also be mentioned. This powder is made of the flowers of the *pyrethrum roseum*, a herb extensively grown on the Dalmatian coast, the cultivation of which is being tried near Ceprano a town in this district about half-way between Naples and Rome. It is found that valerian root, powdered and mixed with the other, renders it more efficacious.

THE DIFFICULTY ABOUT DRUGS.

Experiments have been made in the past summer by Professor Grassi to combat the malady by the use of drugs. In this he has obtained a great measure of success, but here again the expense of the drugs and the difficulty of getting the large quantity necessary, taken at regular times, will form an insuperable difficulty in the case of the peasants. Having selected one of the most malarious places in Italy, Ostia at the mouth of the Tiber, Professor Grassi and his staff have administered six pills a day to adults and a proportionate dose to children, the pills being composed of a compound called "Esanofele," a harmless drug composed of quinine, arsenic, iron and bitter herbs. Which salt of quinine or iron, and the proportions used of each of them, has not yet been disclosed, but Dr Grassi, in his recent work (which is in course of translation into English), speaks most highly of the results and the tabulated statistics of the Ostia treatment appear very favourable, though these are too long and too complicated for reproduction here.—*Madras Mail*, April 23.

PLANTING NOTES.

The Union Estate Company of Ceylon —is certainly one of the unfortunate ones —no dividend for five years and the prospect is not brilliant, apparently, unless there is a determination to abandon any non-paying fields or products and to stick to what we heard long ago described as the really very fine Hayes property. At the same time, the Directors deserve credit for giving up half their fees while no dividend is declared ; —but why not mention this in the Report? It is certainly a fact of special interest to shareholders and well-deserving of a sentence, apart from what may be shown in the accounts. The continuation of our full report will be found elsewhere : the "hecking" was unusually long drawn out.

Arsenic and Treacle.—It is good news that the ravages of locusts can be controlled, if not checked, by means of arsenic and treacle. In Natal, we read, that the locust plague is now easily controlled by this simple means. It would be interesting to know how the remedy can be applied over an extensive area. Coconut planters may do well to try them for beetles ; and why not for porcupines ? The latter pest renders coconut cultivation almost impracticable in parts of the island. The Pallegama Grant suffered severely from porcupines ; estates in the Kurunegala-Puttalam districts are said to have been badly smitten by them ; in the Southern Province, the extension of Cinnamon cultivation is explained by the difficulty of growing coconuts owing to the destructiveness of porcupines ; and even from the Kelani Valley we hear of immense damage done to promising plantations by their fondness for stems just as they begin to show above ground. We should like to hear from some of our more experienced planters, European and Ceylonese, as to the best means of checking the depredations of porcupines—apart from catching them at mischief and then blowing them up !

UGAR PLANTING IN THE STRAITS: AND THE STRAITS' GOVERNOR.

We have had the pleasure of a call recently from Mr. J. Turner, administrator and attorney of the Penang Sugar Estates Co., who was homeward-bound with his family on six months' leave. Mr. Turner visited Ceylon on his way out after his last furlough early in 1900 and had a look at the country as far north as Anuradhapura. He did not think it suitable for sugar-growing as far as he saw; but, on hearing that further north paddy was plentifully grown, Mr. Turner agreed that sugar might there be profitably cultivated while the quantity of irrigation required (the same kind of soil being suitable for sugar that was used for paddy) would vary to a great extent with the quality of the soil and the rainfall. The rainfall on the Penang Estates was on an average 90 to 100 inches per annum. Since Mr. Turner was in Colombo last, the land either planted or taken up for planting by the Penang Sugar Estates Company has more than doubled the Company's property, no less than 9,000 acres being now opened. The estates are worked by a staff of 50 Europeans—"mostly Scotchmen!" Mr. Turner told us—and, though these are comparatively free from tropical affections, several qualified doctors are employed by the Company to keep the native workers in health as far as possible; as many as 150 natives have succumbed from cholera alone. Mr. Turner was able to renew acquaintance today with Mr. im Thurn, calling upon him at the Colonial Secretary's Office—in a far more responsible post than when he knew the latter as the able and scientifically gifted curator of the Demerara Museum.

From Mr. Turner we were further interested to hear of the impression Mr. Taylor had made at the Straits—namely that of an exceedingly hard-working and thorough official, almost too much so for that Colony, and determined to possess a complete acquaintance with the details of all business in his hands. Upon Sir Frank Swettenham, Mr. Turner was loud in praise. He regards this Governor as one who will be "heard of" in years to come with a fame greater than any, based merely on his Colonial Governorships. Sir Frank has, says Mr. Turner, *made* the Malay States; he has opened railways and constructed roads out of revenue derived from the country itself, in a most skilful manner. He has all the gifts and capacity of a progressive colonial statesman, who understands the conditions of growth in comparatively young settlements such as the Straits or Colonial infants-in-arms, nearly such as the Malay States. As such he has proved a welcome addition to the Straits, as one not bound to oppose anything in the nature of progress and even wise enough to overrule local conservatism in the larger and future interests of his charge. Mr. Turner regarded his advocacy of Mr. Matthews' scheme for the improved harbour accommodation at Singapore as a remarkably powerful and intelligent piece of work, and the passing of it by the Legislative Council, in the face of strong mercantile opposition, as an achievement that redounds to the credit of his personal force as well as governing sagacity. Long may Sir Frank be spared to rule the Straits—is the wish we may offer from a flourishing neighbouring Colony, equally blessed with an able Governor who should be "heard of" in days to come—as long as he continues to see and provide for its needs and development as he does today.

LORD LAMINGTON ON QUEENSLAND.

On March 11th, 1902, the Right Hon. Lord Lamington, G.C.M.G., read a paper on "Notes on Queensland."

The Right Hon. the Earl of Onslow, G.C.M.G., a Vice-President of the Institute, presided.

All friends of Queensland have cause for some satisfaction in the facilities which now exist for obtaining information, supported by statistics and figures, relative to the country's progress, as well as interesting accounts of its early history and physical features. And if this circumstance has made it difficult for me to produce in my "Notes on Queensland" matter which is new to you, and, at the same time, free from the embarrassment of political topics (just recently so very much to the fore), it is, at all events, pleasant to know that the many gaps I have left may be filled at larger sources of information. Among these sources I would especially mention General Sir Henry Norman's Paper read before the Manchester Geographical Society in 1896, Sir Horace Tozer's address of three years ago to the Fellows of this Institute*—an address, it will be agreed, that left scarcely a phase of human interest untouched, and publications issued under the auspices of the Government, entitled "A Queen Col ony," and "The Official Year Book," giv a most complete account of the resources and history of Queensland.

The point that first occurs to my mind is the distress that Queensland has suffered, and—according to the most recent news—is, unfortunately, still suffering, through the long period of

DROUGHT.

I hear it is especially severe in the Central and Western districts. According to most people, it is the longest on record. Yet it is somewhat misleading to speak of Queensland as being drought-stricken; the country is one of large areas, and things are rarely ever so bad or ever so good as represented by a general statement. Thus, in October, 1900, I travelled in North-West Queensland, and even in some of the worst of the drought-stricken country I came across districts that fared well. This was owing to their being in the track of some thunderstorms, which, as a rule, follow one another over a particular line of country. But even these smiles of nature are often unreliable. For example, paddocks may be seen with good grass which remains uneaten through the absence of water for the stock to drink. And it is in these cases that artesian wells are of such benefit. On the other hand, a creek may be flowing "a banker," and not a blade of grass in the vicinity. This may occur in the case of a regularly flowing river, as the Gregory, but more often is simply due to thunderstorms that have fallen higher up the river

* Proceedings of the Royal Colonial Institute, vol. xxx. p. 74.

basin. Four years ago I saw an instance when I went on an official tour to Thargomindah and South-West Queensland, accompanied by Sir Horace Tozer. I had continued the journey further to the south-west to see the devastation caused by the rabbits. We were camped on Bulloo Downs, and from the heavy thunderclouds, looking like massive black blocks, I anticipated a drenching night. My companions, however, said it would not rain, and they were right. Never a drop fell in our vicinity, and the heat was intense, but the clouds had burst further north, and, on returning to Thargomindah, our buggy horses were all but swimming where creeks had to be crossed. Even at that date the drought was severe, yet in those places where the heavy thunderstorms had fallen the country's remarkable recuperative powers became apparent, luxurious grass springing up where, but a few days before, there had been the barest ground. Considering the heavy losses that the pastoral interest has suffered during these last years, it is to be hoped that the Government, as the State landlord, will be lenient as regards the payment of rent and the renewal of leases. It is as much the moral duty of the State and to its interest to be lenient to distressed tenants as it is the duty of a private landlord. The question of the

ARTESIAN WATER SUPPLY

has been recently ventilated both by Dr. R Logan Jack and Mr. W Gibbons Cox. Only those who have seen the limitless areas of parched ground, and houses and townships dependent on the storage of water drained from the roof into circular corrugated iron tanks that burn to the touch in the fierce sunlight, can at all adequately appreciate these copious discharges of subterranean water. Mr. Gibbons Cox has emphasised the value of the water for the irrigation and growing of crops. No doubt the water varies much in temperature and in analysis from the different bores, but I know of no instance, as yet, where after two or three years it has not been found unadaptable for this purpose owing to the accumulation of mineral deposit. This does not, however, prove that some of the bores, particularly those that are more shallow, might not be free from this defect. On the other hand, the Government Hydraulic Engineer is not optimistic at present as regards the cultivation of crops by this water, and says it is totally inadequate for the irrigation of grass lands on a large scale, though, of course, of inestimable value for watering stock. On the western border of the Gregory River near Camooweal the country has a limestone formation, and on Rocklands station windmills pump water out of ordinary wells. Though situated on the watershed of the Gregory River that flows north, this subterranean water is believed to drain into the Georgina, flowing south. Incidentally I may mention that this part of the country is in places honeycombed by caves that give no sign of their existence till the observer is close upon them, their entrances being flush with the surface of the land. Further north there are curious limestone rocks, which in one instance almost block one small valley, standing in long parallel rows, and, being grooved horizontally by intersecting lines, they give an impression of walking along the passages of a ruined Cyclopean temple

By way of further confirming my opening remark on the misconception conveyed by the general use of the term drought-stricken, and in contradistinction to this experience of these years of drought when the pastoral and mining interests have so suffered, farming has thriven, sufficient rain having fallen in this more restricted area. In the vicinity of the Russell river the rainfall last year exceeded 246 inches. If at present there is but little

AGRICULTURE

on the western plains, it is not the case on the Darling Downs and on the coast lands, which are rapidly being broken up. Where, five years ago, I shot quail with not a house in sight, is studded today with small farms. Passing along in the train the 20 or 30 feet of rich black soil can be seen in the creeks cut deep through the fertile plains. Land that was worth about 1s an acre per annum for grazing sheep, when under lucerne or other green crop, may be reckoned as bringing in about £1 a year. Such were the figures supplied to me by a squatter who had broken up some thousands of acres. Then there are the farms on the chocolate-coloured volcanic soils of the ranges; these vie with the others in fertility, but the scrub, that is, the jungle, has first to be cleared, and in places they suffer from the soil being washed away off the steep slopes by the torrential rains. Below the range the soil is equally rich, but somewhat stiffer to work, preferred by some, however, on account of the more certain rainfall. On the whole, I regard farming in Queensland as a prosperous industry; no doubt there are some drawbacks, and nature provides many plagues, but by contrast with farming here, I should say there was a far larger margin of profit to be gained by the man who, aided by his family, is willing to work. This is particularly true of the dairying interest, which even during the few years I was there not only developed largely, but made vast improvement in the quality of its products. And it must be remembered that the actual necessities of life are few and easily supplied. Meat is cheap, only light clothing is required, fuel is to be had for the cutting, and for nine months of the year anyone could live comfortably under canvas. Before leaving this part of my subject I should like to briefly notice a pestilence which is, most unfortunately, to be reckoned as a serious evil to the pastoral industry. I refer to

RABBITS.

From what I last heard, it is to be feared they are working north and east. I found difficulty in obtaining reliable information. In Brisbane, for instance, I was most authoritatively assured before setting out on my journey to the south-west that I should see no rabbits. At first this appeared quite correct, but at length we saw a few on Dynevor Downs. As a matter of fact, they were numerous, but owing to the great scarcity of herbage they were scattered in all directions. At any rate, they do sufficient harm to make it worth while to keep on a single run, two or more carts employed in spreading poison. It must be remembered that some stations in those districts have only about ten cattle to the square mile; hence there must be very little spare food. But on Bulloo Downs there could be no question about the existence of rabbits. The land literally swarmed with them, especially to the south of a check rabbit-proof fence. They were living on bushes barked five or six feet high, and were anything but plump. As for rabbits climbing, I may say that I do not be-

lieve they have, up to the present, developed any fresh powers in that direction. To scramble up amongst the thick branches of a bush, as they manage to do up a dry stone dyke in this country, is the full limit of their capability so far as my own observation goes.

Let me now refer

THE GENERAL SCENERY OF THE COUNTRY.

I fancy a stranger's conception of an Australian landscape would be a vista of rolling plains, relieved by sparse green trees of a painfully uniform description. As contrasted with this country, it is quite true, there is a monotony of feature and colour. The close observer, however, will notice distinctions in the vegetation even of the western country, and more pronounced variations from the configuration and vegetation of the eastern. The open plains, with the curiously marked ridges, as if once ploughed, intersected by the stony volcanic open forest ridges, form the characteristics of the Downs. Towards the west these give way to a more park-like country with clumps of the soft grey-green of the brigalow scrub. Further west still there is the cypress pine and mulga. Accompanying these are the gidya (which smells so unpleasantly before and after rain), the bumble orange, lavender bush, sandalwood, glosse box, cinnamon, and countless others. One notable feature about these trees and bushes in that stock in time of drought, when the saltbush and the Mitchell grass are no more, eagerly eat them. It is not until one goes north and reaches the central district that the true open country is seen, entirely devoid of trees. The coast, again, is very dissimilar and the open forest country, being better watered, grows timber much bigger than in the west, whilst on the ranges the scrub land resembles a dense jungle full of vines, creepers, lawyer cane, palms, and gigantic timber.

THE BUNYA PINE

I make special mention of, as it is, I believe, peculiar to Queensland, and even there grows only in a limited area. With leaves not unlike those of an ordinary araucaria, the stem cleans itself of branches, and as it grows old presents a noble appearance, rising perhaps 200 feet, with its vast symmetrical bole crowned by a mushroom-shaped top of deep green foliage. The huge heavy cones contain a seed or nut that tastes like a chestnut. When ripe, natives for hundreds of miles flock to the Bunya Mountains to feast on these seeds, and so rich is the food that they—the natives—become fat and sleek. On the eastern slope of the Main Range the streams and rivers are usually flowing with clear water, through wooded hills, to where the Pacific rolls ceaselessly on the white sands of the coast. Here the most striking features are the isolated peaks of the Glasshouse Mountains, so named by Captain Cook, from their glossy appearance. Further north Mount Larcombe stands out in bold relief. The Barrier Reef protects the shores of Central and Northern Queensland. Some day this will be recognised as an ideal yachting-ground. The numerous uninhabited islands, of almost every conceivable shape, clothed in scrub, scented shrubs, and deep grass—the intricate channels running between, and affording splendid scope for the skill of the navigator—these must before long compel grateful recognition from those in search of change and pleasure. Central and Northern Queensland has a coast line usually bold and rugged. Its dangers are only too evident in the many remains of wrecks which occurred before the coast was properly lighted. In places where the ranges recede from the shore, there are strips of fertile plain and sugar-growing country. Elsewhere clear mountain streams resembling those in the Highlands of Scotland, only with brighter water, flow invitingly. The Whit Sunday, Molle and Albany Passages are well-known for their beauty. The deep channel allows of the steamer passing close along the wooded shores. But the Hinchinbrook Passage of shallower depth is the most picturesque. The rocky peak of the island is over 3,000 feet. High palms and tropical vegetation fringe the base to the water's edge. On the mainland, the mountains tower yet higher in a series of pinnacles. Mourilyan Harbour, Cairns, and Cooktown are all attractive, and Port Douglas is of especial charm. Certainly, I enjoyed nothing more than yachting along these shores, visiting the little-known Barrier Reef islands. This pleasant experience I was enabled to have by the consideration of the Queensland Government. And now let me add a short notice on

THE BIRD-LIFE OF AUSTRALIA.

On the coast country there are to be found many varieties of parrots, cockatoos, the bird-magpies, larks, pigeons and innumerable other species. Nothing could be more melodious than the note of the bell-bird in the thick recesses of the scrub, or more curious to hear than the sharp note of the whip-bird—nothing prettier to see than the black and yellow of the regent-bird, or the claret and black of the rifle-bird. On the western plains flocks of pink galas may be seen whirling in the air. Cockatoos, both black and white, parrots, doves, kingfishers, in addition to the larger forms of bird-life, are also in plenty. Ducks, plain and scrub turkeys, pigeons, quail and snipe are almost the only edible wild birds.

I mention the bird-life to contradict the statement sometimes made that it is scarce in Australia; it is certainly not in Queensland. I might add, too, that the Queensland scrub, I have been informed, is excessively rich in the number and variety of botanical specimens.

Turning now to the consideration of the life of

MANKIND

in Queensland, I think the aboriginal population has first claim on our attention. When brought into contact with civilisation they generally deteriorate. I observed many fine types of robust manhood among them, especially such as lived their natural life, uncontaminated by the evil influences of civilisation. They have great muscular strength and activity, are fast runners and high jumpers. As a race, they are very callous to pain. In their tribal conflicts the most severe wounds would be treated with indifference. One mode of punishment is for two or three men to thrust a spear through the body, and I have heard of a native walking sixty miles with a spear through him before he could get help to pull it out. Their intelligence always impressed me, as did their quickness of comprehension. In the back blocks they usually work as stockmen on the runs, and one most capable and successful manager told me he preferred to employ black boys, both on account of their intelligence and reliability. In a mission school at Mapoon I was told the children were quite as intelligent as white children. It is apparent, therefore, that their inferiority, as a people, is not so great as is usually represented. Perhaps, too, the improvement is

more marked as one goes north. To reflect on the swift disappearance of their former thousands is somewhat terrible—in fact appalling. Except in the N. W. and in the Cape York Peninsula, their camps are few and but sparsely occupied. Drink, opium, and disease have mainly contributed to their disappearance, and deeds of violence have not been altogether wanting. Had large reserves been established in the first instance, missionaries and education might have developed a moral spirit that would have combated more successfully the worst influences of civilisation. I do not pretend that the race would have been perpetuated indefinitely, but at least its existence would have been prolonged. They have undoubtedly suffered at the hands of our race, and I never could learn for certain of a single authenticated case where the wild blacks injured a white man or his property without some provocation having been given previously by a white man, or occasionally by one of the new-comers through ignorance giving offence by a neglect of their superstitions. From their inability to differentiate between one white and another, the provocation may have been given by a very different party to the one upon whom revenge was inflicted, and, perhaps, at a date long anterior, whereas the oldest residents have told me sad tales of the punishment and cruelties inflicted when a murder had been committed by

THE NATIVES.

Here I may quote the experience of Mr. Petrie. He settled at North Pine about forty-two years ago and can remember seeing tribal fights take place where now the Brisbane Exhibition building stands. Some white settlers had made complaints of natives who were in hundreds about the place. He was, however, considerate to them, and, as a result, never lost a single bullock. He would leave them in charge of his house, and never missed even an ounce of tobacco. They would bring him presents, as they did to anyone who treated them with any consideration, and, furthermore, their conduct towards shipwrecked people was generally good. The two most frequent causes of trouble were the taking of black women by the settlers, and in the spearing of cattle by the blacks. The former incident invariably led to the trouble, and in connection with the second, it must be remembered that the natives were largely deprived of their means of subsistence by pastoral and mining occupation, and hunting, in consequence, almost ceased because of its difficulties. What were the blacks to do? Surely they had a claim for protection, and not to run the risk of being dispersed and shot. At no time are they liked on a run, as the cattle get frightened by their appearance amongst them. "It is impossible," as a judge said in a summing-up, "to overcome racial prejudices where juries of another colour are employed." I hope matters are now on a different footing. I am proud to think that the first real remedial measure was passed during my term of office. Sir Horace Tozer was then Home Secretary. His strenuous and humane endeavours to bring about happier relations are, I am glad to say, being vigorously maintained by his successor, the Hon. J F G Foxton. The continuance of Sir Horace's policy is especially noticeable in the Acts prohibiting the sale of drink and opium to aboriginals and half-castes. Doubtless these are provisions very hard to enforce in dealing with semi-civilised nations. Again, as part of the general scheme of improvement, protectors have been appointed to exercise supervision. One of these, Dr. Roth, has been specially selected for his interest in native life and his ability to administer medical treatment in cases of disease. I may say here that a native believes that sickness or death is always due to the operations of some foe, and has no idea that they could possibly result from physical causes, and does not therefore understand taking any steps to guard against illness. But perhaps the most beneficial feature of these Acts is to be found in their causing the natives to be regarded as fellow-creatures worthy of help, rather than troublesome beings whose presence was unwelcome and irksome. Greater precautions, too, have been taken against cruel and unfair treatment where natives engage to serve on the pearl or bêche-de-mer fishing boats. These were grievously necessary. It must be remembered that the pioneers of civilisation are not always given to sentiment.

The Missions that have started are meeting with considerable success. The children afford the best, if not only, chance of obtaining permanent good results. The great obstacle to improvement in the adult consists in the lack of any appreciation of wants beyond those of bodily gratification for the moment. The perfect communism that prevails is chiefly responsible for this characteristic. Everything a man possesses, or may earn, is at once shared by all other members of the family or tribe, old and young. The chief incentive to work is thereby removed. Mr. Hey, the missionary in charge of Mapoon, quoted to me how a native came to him who had earned two bags of flour as wages. He shared one with the rest of the tribe, but saved the other by handing it over to the custody of the missonary who, from time to time, doled the flour out as required But as each dole had to be shared with his friends and relatives the poor native merely became a philanthropist on a sort of instalment system, and failed utterly as a domestic economist. Perhaps the only sense of property is to be found in respect of their weapons and dogs. The absence of this sense might, I believe, be traced to the want of any religious faith. They receive no guide to present conduct by looking to the future or hereafter. The present day is the only consideration, without the slightest regard to the next. In a greater or lesser degree I believe this to be a great factor in the disappearance of a race.

To turn to topics more associated with

THE NEWCOMERS

is now our business. Outside of political questions, I suppose, there is none of greater interest than of climate. Indeed, it has, in the last few months, assumed the aspect of a political question in itself. I always endeavoured to learn what doctors and others possessed of experience thought upon this point. Naturally, there was some divergence of opinion, but, on the whole, it was corroborative. I will make a geneal deduction, but allowance must be made for the vast area of country and consequent local variations. To begin with, the death-rate of Brisbane in 1899 was 10 90 per 1,000—the lowest for any of the Australian capitals. For the year 1900 the death-rate of Brisbane was 14·99 per 1,000, and for the colony of Queensland 11·72 per 1,000. The higher rate of Brisbane is due partly to the more crowded con-

ditions of life, and also to the unhealthy lives drawn there for treatment, but the average rate of 11·96 for the quinquennial period 1896-1900 compares very favourably with the other Australian Colonies. These figures are omitting consideration of the coloured races. As regards Southern Queensland, there can be little, if any, doubt of its healthy character, especially to the west of the main range. Although there is rarely the extreme heat that is experienced in Southern Australia, it may be contended that some people feel the summers long and hot. Many, therefore, like to go to the south for a change, but equally, people in this country like to go to the Rivera or Egypt, and yet the cold here could not be described as unbearable or rigorous, as in the Arctic. These remarks apply also to Central Queensland, only in rather a greater degree. In Northern Queensland and to the north of Townsville, it would hardly be denied that continuous residence in the coast country *does* have a relaxing effect, and that there the white race could not retain its vigour and robustness. Once on the high ranges parallel with, and not far from the coast, I believe living to be quite as healthy as in any other part. One morning at Herberton my thermometer was down below freezing-point at my bedstead. Here (and this remark applies to the greater portion of Queensland) the air is wonderfully light and refreshing. Possibly, there is some connection between this atmospheric condition and the great rarity of sunstroke, for the head covering of the men in the bush always seemed a very moderate protection. To summarise, I believe that man can engage in almost any kind of labour, except such forms as cane-trashing and cutting, in the tropical regions without deterioration. But the female portion of the community must not be forgotten, The more active the life so much the less does a woman suffer from the heat. From what doctors and others have told me, without, I think, a dissenting opinion, on the tropical coastlands or in the gulf-country white women cannot, as a rule, bring up families without injury to health. On the other hand, it must be remembered that, if the climate in these small portions of the country has a deleterious effect for some, many have come to Queensland to save their lives, and this the dry air of the Downs and western plains especially has done for them. Though it is too early to judge with certainty, one may reasonably assume that, with a climate very different from what obtains here, there will in time be some variation in stock, and the race may become of slighter build, but wiry. On the whole

QUEENSLAND MAY BE PROUD OF ITS CLIMATE

when contrasted with other places of equal latitude elsewhere. With the exceptions before mentioned, the whole of the work is done by the white man. Townsville is, essentially, an Anglo-Saxon town. Yet it is of the same latitude that passes through Mauritius, the heart of Madagascar, Beira, Matabeleland, and, to the east, Fiji, South Sea Islands, Chili, Bolivia, and well to the north of Rio Janeiro, in all of which places labour is carried on by coloured natives or half-breeds. In making this comparison, let it be remembered that Townsville is only in the south-eastern corner of Northern Queensland, and that Croydon, Cooktown, and other places are nearer the Equator, and yet the mining and other work is done there by white men. Whilst on this topic I may allude to a habit closely connected with the health of a country. I mean the drinking of spirituous liquors. From my own observation and from the information of others, I may say that, whilst it is usually said that habits of drinking are rife, it is certainly not the case, especially amongst the younger generation who are noticeably abstemious. This must, of necessity, have a beneficial effect on the health of the population. I believe any drinking that may have existed is chiefly due, in the first place, to the pernicious habit of "shouting." Those in the higher ranks of life should now be able to meet without it being thought necessary to treat all around them, and it should not be considered mean for a man to order only what he wants for himself. Another evil is to be found in the bad quality of liquor sold in the back blocks.

I was much struck by the number of hospitals scattered throughout the country. Till recently, in this land, where we are now, hospitals were almost unknown outside the large towns. But in the most thinly populated parts of Queensland a home for the sick and injured is within reasonable distance, considering the vastness of the territory. Great pride is taken in the maintenance of these hospitals, and money is rarely asked for in vain. These are managed by the subscribers, and the State contributes £2 for every £1 locally raised. With one exception they always seemed most carefully and excellently managed, and Lady Lamington, who has interested herself in this subject, would testify to their being at least equal, if not superior, to the country hospitals she has seen over here. The best site in the town or township is well-nigh always occupied by the hospital or by a Roman Catholic Institution.

As regards the general advancement, Queensland moves of course on similar principles to those of the rest of Australia, and it is curious to note the divergent lines of development followed by the two great branches of the British race. In the United States of America

INDIVIDUALISM HAS HAD FULL PLAY.

A man there is self-reliant, and ever believes he will himself make his way. In Australia the Government and the laws are looked to in every department of activity for support, direct or indirect, and the laws passed are usually opposed, as much as possible, to the accumulation of capital in the hands of the employer. This policy may procure a more dead level of the diffusion of wealth, and ensure the happiness of the greater number, to a wider extent, than that sudden creation and disappearance of fortunes in the United States, but it necessarily checks that great amount of enterprise, development of resources, and increase of wealth that so prominently characterises the progress of the latter. Another minor comparison I used to note, and the difference is, perhaps, due to the same causes. This consists in the essentially peaceful character of Australian development. As a nation, it is, of course, without parallel. No country has ever attained such prosperity unchallenged by any foe from within or without. But in private individual life the inhabitants, too, themselves, except when the great rush was made at the discovery of the goldfields, have always quietly pursued their way, and weapons of offence have been unknown; whereas in some of the American States, if not today, at any rate till quite recently, a revolver or a bowie-knife was an essential part of a man's every-day attire.

Coming to a general review of Queensland, I should first of all like to mention the fact that throughout the rivalry of the different States it was always conceded, by the southern States, that Queensland was destined to become the richest and most prosperous in Australia. It has such an enormous variety of sources of wealth; its agricultural products alone would take long to enumerate, drawn as they are from the subtropical and tropical zones. In public, and privately to me, has this often been allowed; and I believe that the future will prove the estimate to be a true one. For my part (and here again I have had the support of outside opinion), I believe its Governments have always been amongst the most patriotic and far-sighted—in other words, the most statesmanlike. I think it proved not only by internal policy, but external as well. As regards the former, the civil administration is on a better basis than can be said of some of the other States. And in my opinion the officials are better instructed. I could give an instance of this from events which occurred after the declaration of the Commonwealth. Sir Samuel Griffith, the present Lieut. Governor and Chief Justice of Queensland, is, to a large extent, responsible for this satisfactory position, as also for the codification of the criminal law. The Government accounts are well kept, and, thanks to a prudent measure passed by Sir Hugh Nelson, the surplus of any one year is automatically handed over for the discharge of public debt. Thus, it is the wish of every Treasurer to pay every account possible before striking his annual balance on June 30, and not to allow an accumulation of arrears by parading a large surplus as regards external affairs. Successive Prime Ministers have invariably shown themselves large-minded in dealing with British New Guinea, and Governors have never lacked support in carrying out their policy despite its complex system of administration, even though, now and again, there has been some little pressure applied to exploit the possession more in the interest of the white man than that of its own inhabitants. The recruiting of the Kanaka labourers has been carried out with the greatest humanity. As I have already stated, Acts have been passed to improve the condition of the aborigines. Adhesion was given to the treaty with Japan, by which the influx of Japanese is placed under control. In this matter Queensland stood alone amongst the States, as I believe she alone, despite the financial depression, has not reduced the salary of the Governor under the Federation. Her regard for her position as a State entity would not risk the decline that might result from reducing the position of its head. She was the first of all the Colonies to offer troops for service in South Africa before the war broke out. She has a system of local government; this decentralisation of business and handing over responsibility to local authorities must tend to a truer appreciation and recognition for the proper supervision of the duties of the government of a country. The admirable lighting of its coast for 1,200 miles is most creditable for a population now, today, only numbering half a million. She was always foremost in maintaining the Federal Council, in erecting Federal forts, and in maintaining and supplying Federal garrisons. She was urgent, too, in the matter of the Pacific cable, and, perhaps, though a small point, I cannot better prove what I mean by the broad and statesmanlike attitude of Queensland than by mentioning that she alone of the Australian States gave £1,000 to the cost of the Antarctic Expedition, though, presumably, the State least directly interested.

These considerations make one's sympathies the keener for Queensland under its present disagreeable circumstances. The uncertainty of the operation of the Federal tariff hampers its trade. Without discussing the merits or demerits of the Kanaka question, it is hard that, at a time when nature has sorely troubled the country by lack of rain, a prosperous industry should be threatened with extinction. At least such is the opinion of those who have given their labour and money to it. Even if their fears are exaggerated, one can feel for the men who have developed, and so have the real stake in, the country, whilst we can feel for the Government who have aided them in their enterprise, and on whom these anxious fears must re act in the sense of a threatened loss of security for capital, and in a diminution of revenue. Queensland went grudgingly into Federation, knowing her conditions and characteristics were unlike the rest of Australia, and might not be recognised. It must be unpleasant for the responsible authorities to find their fears were to a certain extent justified.

Before I conclude, I must refer to what, to me, as the constitutional chief of the State, was the most agreeable feature—viz., the deep-rooted attachment that is entertained to the Sovereign of this Empire—H.M. the King. I used often to marvel, when visiting some distant lonely settlement, to find how fervent was the loyalty, even amongst people that one would suppose so remotely situated as to lose a sense of such ties. What a wonderful work has been accomplished by one remarkable personality! I speak of our late Queen. How her bright shining goodness and sense of responsibility have gained an influence, widespread and deep, in these hearts and minds—an influence strengthened by the recent journey of Their Royal Highnesses, the Prince and Princess of Wales, which is well known to have been sanctioned by Her late Majesty! Being privileged to remain in Queensland in order to receive Their Royal Highnesses, I know something of the impression created by their visit, when they showed such pleasure in becoming acquainted with as many people as time would allow, and in informing themselves of everything that concerned the commerce, politics, and life of the great dependency. The fruits of these inquiries we have seen in the remarkable speech of H.R.H. the Prince of Wales at the Guildhall, a speech that is often referred to and quoted.

Before I sit down let me repeat my opening observation with regard to a general account of Queensland. Nothing of the kind has been attempted here. I have merely touched upon some matters that often engaged my attention during the happy years that Lady Lamington and myself spent in a country to which our thoughts often revert, and toward which the best wishes of our hearts will ever go forth.

The Paper was illustrated by a series of Lantern Views.

The CHAIRMAN (The Earl of Onslow, G.C.M.G.):—I am sorry I must leave now, in order to catch a train, but Lord Brassey, formerly Governor of Victoria, has kindly consented to take my place.

The CHAIRMAN (Lord Brassey, K.C.B.):...I—will now conclude the proceedings in the usual way by tendering on your behalf a most hearty vote of

thanks to Lord Lamington for his interesting paper. Everybody who has spoken—and we have had many interesting speeches—has highly and most justly praised the paper. Allusions have been made to one or two points which are not dealt with in the paper. They were not dealt with for the obvious reason that they were controversial, and those of us who has been Constitutional Governors in Australia have been trained to know our duty in the avoidance of matters of controversy. I desire to associate myself in the fullest sense with all that Lord Lamington has said, of regard and appreciation of Australia and its people. We sometimes exchanged visits. On more than one occasion I had the pleasure of travelling in Queensland and of voyaging along its beautiful coast. I have undying recollections of the Hinchinbrook Passage, and my visit extended to the extremest point of Thursday Island. Many of my Victorian subjects were deeply interested in Queensland properties, and I admired greatly the spirit of enterprise with which they endeavoured to develop their resources. Nothing which science could do to cope with the difficulties which climatic conditions too often present to enterprising settlers was left undone. We can only hope that they and all those interested in Queensland may meet with the reward they deserve. Some speakers have been able to present a most encouraging picture of Queensland, which I hope will attract youthful enterprise and benefit that State.

Lord LAMINGTON, G C M G :—I wish to acknowledge with extreme gratitude the kind references made to my paper. I only wish it had been more complete, but I thought on an occasion like this it was best to take only certain topics for treatment. As to the subject of industries, which I regret I have omitted, I may say that for a new country they are very considerable, and I may mention that Maryborough has perhaps the largest and most complete iron works in all Australia. As to the sugar question, I cannot help thinking there is perhaps a little excess of fear, for if Kanakas are not obtainable there may be found some other form of labour to be engaged on the sugar-cane fields, which will be able to afford the planters the means of producing sugar in the future as in the past. I understand that coolies are proceeding in large numbers up north. I should not like to dispel the pleasing illusions which Sir Arthur Hodgson has indulged in respect to the cattle camp provided for the inspection of Their Royal Highnesses. I listened with interest to Dr. Jack's statement with regard to Mr Kennedy, and I regret to hear that the authenticity of the treacherous conduct he described can be established. But I adhere to the opinion that in earlier times it ought to have been the business of the responsible authority to see that there was some reserve or that something was done to endeavour to prevent the two races coming in conflict one with another. I will conclude by expressing my admiration for the great earnestness of the Australian character. I noted, so far as my own experience went, that whatever they took up they endeavoured to carry through. Whether in sport or in business, they are thoroughly in earnest, and in whatever they engage their methods are thorough. I will ask you to join in giving a hearty vote of thanks to our Chairman, Lord Onslow. I regret that he has been compelled to leave, but we are grateful for his presence so long as he was here, because a man engaged as under-Secretary for the Colonies has not many leisure evenings. We are deeply indebted to our friend, Lord Brassey, for taking his place. Lord Brassey and I often came together when he was Governor of Victoria. He by no means restricted his interests to that prosperous State, but made himself thoroughly acquainted with the rest of Australia. He was most intent always on the duties of his position, and I regard it as an honour that we have had his presence on this occasion.

THE BALATA OF VENEZUELA.

An extraordinary yield of Venezuelan balata (a species of gutta-percha) is recorded in the journal "El Guaynes," of Upata in that republic. During the twelve months ending with October last, according to that paper, 1,840,000 kilograms (equal to 4,048,000 pounds) of balata were shipped from the ports of San Felix and Guri, in the territory of Yuruary, to Ciudad Bolivar. The district lies south of the Orinoco and east of its tributary, the Caroni, besides which the region is drained in part by the Yuruary and Imatacca rivers. This balata paid a tax to the State of Bolivar equal to about 4 cents. gold per kilogram (the rate has since been doubled), and two cents to the national treasury of Venezuela. Besides, there were 772 dols. collected in company taxes, fees, etc. The total public revenue from Balata was 11,425,60 dols. The export value of the balata, according to our contemporary, was equivalent on an average to 38 cents gold per pound, bringing the total value for twelve months up to 1,538,200 dols. —*Indiarubber Trades' Journal*, March 31,

RUBY DEVELOPMENT CO., LIMITED.

(73,081).—Registered March 13, with capital £4,000, in £1 shares, to adopt an agreement with R Oblatt and L and N Karpf, to acquire patents, inventions, licences and information relating to the re-construction of rubies, to re-construct work, to sell, purchase and deal with rubies and precious metals and to carry on the business of jewellers, goldsmiths, silversmiths, etc. No initial public issue. The number of Directors is not to be less than 4 or more than 6; the first are L Karpf, N Karpf, R Oblatt and A Raphael. The three first-named are anent; qualification £250. Registered office, 67, Banner Street, Finsbury, E C.—*Investors' Guardian* March 29.

A CHINESE EXTRACT OF TEA.

At a meeting of the Pharmaceutical Society of Great Britain, held on the 15th ult., Dr Augustine Henry, who was described by the President of the Society as "the greatest living authority in Chinese drugs" delivered a lecture on that subject. In a report of the lecture the *Chemist and Druggist* says that a sample of *Extract of Tea* made in the office of the Prefect at Szemao and used only by the Dowager-Empress, to whom it is sent as tribute, was shown. It is in the form of a yellowish-brown powder, and contains 6 per cent. of caffeine and 12 per cent of tannin,

WILD COFFEE IN CENTRAL AFRICA.

AN APPARENT HYBRID.

Beyond the Lusambo on the shores of the Sankuru grows a very wild interesting kind of *Coffee-tree*, which is apparently new. It exists also, it is said, in abundance on the left bank of the Lomani, west of the Gandu. It is a small tree three to five yards high with branches spreading out often over the streams with fine leaves larger than those of the Liberian Coffee, and small flowers, smaller than those of the Arabian variety. The berries are of medium size, the seeds rather small and regular and have a very delicate aroma. Coffee of this kind that had been gathered towards Gandu tastes excellent. This coffee is said to abound in the woods on the left bank of the Lomani, and is even cultivated in certain villages. This variety has been cultivated, first by the Arabs, and then by M. Gillain at Lusambo station, where there is about five hundred trees. In the same plantation there were some Liberian coffee trees planted at the same time, but which had not developed so well as this wild kind. This is attributed to the nature of the soil of Lusambo: a silicious earth, rich in vegetable soil for twenty or thirty centimetres down. In such land one must give up Liberian in favour of the new kind, accustomed to grow on the sandy soils so common in the basins of the upper Kassai, Sankuru and the Lomani. This coffee seems to have a great future before it, especially after the southern portion of the great forests is opened up to cultivation.

ANOTHER VARIETY.

In an island of the Lualaba, above Wabundu, grows, in a wild state, a kind of coffee much like the Arabian. It is also found opposite Coquilhatville and on the banks of the Uelle and the Ubangi. It forms a shrub 6 to 18 feet high, with narrow leaves, small elongated beans, rather small berries of rather irregular shape owing to there being often three berries in a bean. The colour of the berry is grey, and there is so little aroma that many berries are required to produce a fair cup of coffee.

A TRUE LIBERIAN.

At Wanie Kukula, there is in the forest another kind of wild coffee whose reputation has no longer to be made: Liberian coffee living in the forest under the shade of great trees. There are trees in flower 30 to 40 feet high, the trunks of which measured 15 to 25 centimetres in diameter 3 feet from the ground. They bore branches only at the summit of the stems, which is explained by the struggle for light of the denizens of the forest. The seeds are a little smaller than those of the cultivated Liberian trees. In every point the wild and the cultivated Liberian resemble one another, and in a plantation of 5 to 6 hundred trees near by it was not possible to distinguish them. The trees belonged to some Arab Chiefs to whom the Commandant Lothaire had advised as to the cultivation of wild coffee and had given seeds of the cultivated variety.

THREE DISTINCT KINDS.

We must note then the existence, in their wild state, of three different kinds of coffee in the Congo State, and two of these have a great economic importance. For if equatorial Africa is the home of these precious plants, there is no doubt that they may be cultivated there with success. To satisfy oneself, it is sufficient to visit the plantations of Wabundu, and especially those of Stanley Falls. At the latter Station, 400 trees were planted in 1890 on the recent deposits of the left bank of the river. They are very fine and covered with berries; one of these trees was photographed after it had been stripped. The fruits weighed 21 kilog, (47 lb.) which corresponds to about 3 kilo. of coffee (7 lb.) After the Arab campaign, coffee planting was resumed vigorously under the direction of M Rom. Last year there were more than 5,500 plants over a year old and growing vigorously.—*Madras Mail*, April 26.

MR. JOHN HUGHES AND BASIC SUPERPHOSPHATE.

Basic superphosphate is a manure prepared by mixing superphosphate with slaked lime, and is distinctly alkaline, combining the solubility of superphosphate with the alkaline nature of slag. It is particularly adapted for clayey, gravelly, sandy, granitic, or peaty soils, and in general for all soils having less than 1 per cent of lime. It is in the form of a dry powder easily applied. According to the inventor, Mr. John Hughes, it is intended to take an intermediate position between slag and superphosphate, and results in the field last season confirm those of the laboratory.—*Globe*, April 18.

THE CULTIVATION OF TEA IN LOWER BURMA

has disappeared. The late Dr. Mountjoy cultivated it successfully in the Akyab district for many years. He commenced in 1862 and gained a prize for the excellent quality of his tea at the Calcutta Agricultural Exhibition in 1863 64. In 1876-77 the outturn of tea in the Akyab district amounted to 25,374 lb. Accoring to the *Rangoon Times* no tea has been grown in Lower Burma for some time past, though the returns for Upper Burma last year show 249 acres under tea in the Katha district, and 1,167 acres in the Upper Chindwin —*Indian Planters' Gazette*, April 26.

GROWING TOMATOES.—Most Growers of tomatoes for sale or export aim at producing very large smooth fruit. That the smooth variety is preferred to the wrinkle kind is evident from the fact that the public, as a rule, do not care for the latter and that a better price can be obtained for the former. But abnormally large tomatoes are a mistake. As a general rule, the public prefer a moderate size. The housewife does not like getting two or three fruits to the lb. because there is often much wasted in the large sizes. From 2 to 3 inches in diameter is quite large enough, and such tomatoes will always command a better ptice than the very large ones, which are more useful to the cook for "fancy work" than for general purposes.—*Queensland Agricultural Journal* for March.

PESTS AND DISEASES.—Caterpillars, slugs, flies, locusts, birds, worms, scale insects, fungoid diseases of various sorts, will all attack your garden in their turn, and they must be destroyed as soon as they appear, or there will be very little pocket-money. What is the best way of fighting them all? In a small garden you can do a great deal by picking off the caterpillars, but the slugs (*vaginula* particularly) are night intruders, and these may be destroyed by the use of the powder of tobacco refuse. A dusting of this is fatal to them. Then there are sprays which will destroy both insect parasites and fungous diseases. Whale oil soap, 1 lb to 2 gallons of warm water, applied when cold, is an excellent spray. Paris green and Bordeaux mixture will also help. If taken in time most of the enemies of the vegetable garden can be destroyed by proper appliances. Study the writings of scientific vegetable gardeners, and make use of the remedies suggested by them and you will find that you will be successful with your garden, and still have plenty of time to do chores on the farm.—*Queensland Agricultural Journal* for March,

THE CEYLON TEA SALES OF LAST YEAR.

DECREASE IN AVERAGE AND OUTPUT; BOTH LOCALLY AND AT HOME.

It is interesting to compare the results of the local (Colombo) Tea Sales for 1901, as compiled for our contemporary the other day and quoted elsewhere, with the Tea Memoranda and London Sales of 1901, reported by Messrs. Wilson Smithett & Co. which we published last month. It will have been observed that the London average for 1901 is nearly a half-penny less than for 1900, notwithstanding the finer "plucking" observed at this end and the poor season which so largely aided reduction of crop. Looking over estates, we observe that in some of the high districts the falling-off is more than ½d. For St. Leonards, for instance, it is ⅝d; but then it gave a larger yield by 90,000 lb. last year, but the Mincing Lane Brokers remark generally on a falling off in Udapussellawa teas, perhaps due to an unfavourable season. Badulla is a half-penny better; but the outturn was less by 130,000 lb.—possibly in a great degree through less leaf being bought. Again Talawakelle average is down ⅝d, but with more tea by 40,000 lb. It is, however, impossible to institute fair comparisons all round, without knowing whether any of the tea from particular estates is sold in Colombo. Possibly 1901 may have seen some sold locally that in the previous year went to London, and *vice versa*.

Turning to the local Sales of 1901, we note that the high districts have shown a similar falling off in the local sales, which inevitably reflect the home market to a large extent. Naseby, it is true, is actually *7 cents* above its figure for 1900; but Monkswood shows a drop of 1 cent, St. John's 2 cents, High Forest 13 cents (a big drop from the first place it held last year with the 59 cents that Naseby holds this year), Dunbar, Dunkeld, Queensland and Tonacombe 2 cents, Mocha 7 cents and Maha Uva 3 cents. A rise is shown by only two estates, beside Naseby, out of 25 high-grown; we refer to Glasgow (1 cent) and Malvern (4 cents). Glasgow showed the large output of 333,500 lb. at an average of 46 cents and Malvern 54,000, at 37 cents Turning to low-grown tea we see that here also only three estates among the best show an increased average :—Weoya (by 4 cents), Glencorse (1 cent) and Polatagama 2 cents; their outputs were, respectively, 134,000 lb., 148,000 lb. and 280,000 lb. The output of Naseby we should mention, seeing how its result stands out amongst the rest, was a medium one, 87,000 lb., in proportion to the other totals, though this means a yield of 550 lb. per acre. The biggest yields have for the most part been obtained by estates showing an average of 31 cents and over. But they are all surpassed by two: Yataderia (415.000 lb.) and Kurulugalla (655,000 lb.) with averages of 30 and 25 cents respectively; below the 31 cents average the next highest is Rayigam (290,000 lb.) with average 28 cents. Above 30 cents we find the yields as follows :—

		Yield.	Average.
Vogan	...	383,000 lb	32 cents
High Forest	...	371.000 ,,	46 ,,
Glasgow	...	333,500 ,,	46 ,,
Pallagodda	...	325,000 ,,	32 ,,
Agra Ouvah	...	324,000 ,,	47 ,,
Marlborough	...	323,500 ,,	38 ,,
Chesterford	...	312,300 ,,	31 ,,

The output for the whole year is very slightly less than in 1900—a decrease by a fraction per cent, namely by 97,065 lb. on 38,442,926, but the average shows 1½ cents decrease; this is not so bad as the drop of very nearly 4 cents that came about in 1900; but it is bad enough, seeing how low the average has sunk in the past 10 years. We give in conclusion, the annual totals sold in Colombo and averages obtained, for the past ten years as follows :—

ANNUAL TOTAL AND AVERAGE.

		lbs.		Cents.

VEGETABLE PRODUCTS IN MINCING LANE.

At this time of the year, when the British public generally is more or less interesting itself in the Chancellor of the Exchequer's Budget, our thoughts run over a wide range of commercial products, or likely sources of taxation that may possibly suggest themselves to the resourceful and fertile mind of the Chancellor, and that will not press too heavily on any class of the community in particular. In doing this we cannot help being struck with the prominent part the vegetable kingdom plays in the realisation of revenue. A glance even at the Customs Tariff of the United Kingdom which, of course, is a list of those articles which are already liable to duty, proves the truth of this statement, not only with regard to the number of vegetable products in comparison with those from other sources, but also to the absence of many other well-known substances of equal or even more importance, and which would probably yield large sums, were a slight duty chargeable. Tobacco, Tea, and Sugar are, as everybody knows, fruitful sources of revenue which, though the rates upon each may be varied, will, like the income tax, probably never be surrendered. Probably, however, there are comparatively few people who have any idea of the important position fruits and flowers under different forms hold in the Customs tariff, and the unequal manner under which they are taxed; thus, while dried Currants pay only two shillings per cwt., Raisins are charged seven shillings—very unequal rates for two varieties of the Grape, the presence or absence of "stones" or seeds in the fruit apparently making all the difference, and yet not entirely so, for the Sultana (a stoneless Grape) is classified as a Raisin, while some of the very large Currants now often seen in the market are sometimes a puzzle even to the Customs authorities, who have to decide whether they should be classified as Currants or Raisins. Figs and Fig-cake, Plums, and Prunes are chargeable with the same rate as Raisins; while canned

and bottled fruits preserved in thin syrup pay one shilling per cwt., the same preserved in thick syrup have to pay two shillings more, or three shillings per cwt. Crystallised fruits are distinguished from others by a higher rate, namely 4s 2d per cwt. Ginger preserved in syrup or sugar is charged three shillings per cwt., while preserved Tamarinds pay only one shilling.

Flowers occur in the Customs tariff in one form only, and this not in a fresh or dried state, but in the condition of sweetmeat, namely, the crystallised flowers of the Violet, Rose, Orange, and which are charged at the same rate as crystallised fruits, namely, 4s 2d per cwt.

If the Chancellor of the Exchequer were to take a walk through the several brokers' show-rooms in Mincing Lane, he would, no doubt, become imbued with new ideas of taxation; at any rate a glance down the reports of the London market in that busy corner of the great city is a lesson of much interest and great educational value, for it is chiefly in these reports that we first find references to products new to commerce—things that are sent into market at first in small quantities to test their suitability as marketable articles, and their prospect of finding purchasers. Products of this kind of any real value seldom make their way with any flourish of trumpets, but become quietly established, the demand increasing as their properties become known.

The case, is, perhaps, rather different with regard to medicinal products. Any new discovery in this direction has of late years been made the cause of many much-advertised quack medicines, though some of them have proved of value, and have found a place in the *Pharmacopœia*, such as Coca (Erythroxylon coca), and Cascara Sagrada (Rhamnus Purshiana), and others. In the Mincing Lane classification of products, it is sometimes difficult to find any special article; for instance, one unacquainted with the ways of product brokers would scarcely expect to find Chillies classed with spices, but in such company they are always placed, though the principal use of the Chillie is as a condiment, either for making cayenne pepper or for mixing with pickles. Very large quantities of these pungent fruits now come into English commerce, and it is said that the increased demand is to some extent due to the use of much larger quantities than has hitherto been the case in the West of England pilchard preserving trade though there is also a fairly good demand for them in medicine.

The geographical range of commercial Chillies has of late years become much wider than formerly, for, beside the regular source from India, we receive Chillies of good quality and very bright appearance from Nyassaland, Sierra Leone, and Zanzibar; and more recently from Japan. The botanical source of the African Chillies is attributed to Capsicum minimum, and though the general appearance of the Japanese form is very similar, it is usually somewhat larger and has less pungency; and it has been suggested that it may be a small form of C, annuum. The market value of Chillies varies from 38s per cwt for ordinary mixed Zanzibar to 52s for good red Nyassaland fruits, but these prices are affected by the ebb and flow of supply and demand.

Speaking of spices, one would rather expect to find Vanilla under this head, but so important is this valuable product in the Mincing Lane trade that it is not only placed under a separate heading in the market reports, but the samples themselves are always shown in a separate showroom, and indeed in a distinct building.

The extension of the cultivation of Vanilla, not only in new plantations, but also in entirely new countries, is sufficient proof of its constant demand, and of its value as a profitable crop; and this notwithstanding the continued manufacture and use of artificial vanilline. The following facts on the present condition of the trade in Vanilla are gathered from our well-informed contemporary, the *Chemist and Druggist*, who, in reporting on the Vanilla sales at the end of last month, says that the supply brought forward was the heaviest on record and attracted a much larger attendance of buyers than usual. There was, however, a good demand and practically the whole quantity offered, about 2,800 tons, was sold. Long lengths, being scarce, brought good prices while medium lengths, also sold, were pods from 8 to 8½ inches long, and of good chocolate colour and fetched 22s 6d per lb; 7½ to 8 inches, 19s 6d to 21s 6d; and so on in proportion, for it must be remembered that Vanilla pods are classified in the market and valued according to their length, plumpness, and colour. Thus, at the same sale the lowest grade of dry, brown pods realised only from 4s to 11s 6d per lb:

Referring to the condition and prospects of Vanilla cultivation in the Seychelles, Messrs. Brookes & Green, the well-known brokers, state that the Seychelles crop for 1901, shipped from August to December, totalled fully double the heaviest quantity exported from the island in any previous season, it being estimated at about 80 tons. The feature of this season's supply of Vanilla from the Seychelles is the unprecedented large proportion of short beans. Medium to good size quality measure from 6 to 8 inches, but the consignments landed in London during the past three months have contained about 75 per cent of very short beans, ranging from 3 to 5 inches. The result has been that, whilst long-length quality has fairly maintained previous values, the short measurements show a reduction of about 50 per cent. To obtain good plump pods, it is incumbent for planters to see that early in the season the young shoots are thinned by picking out a quantity of surplus sprouts; in the present case it would seem as though nearly all had been allowed to grow. This view is somewhat confirmed by recent reports from the Seychelles, which advise that the flowering for the next crop is small—possibly due to the weakening of the vines last year; indeed, some of the older plants are reported as seriously exhausted—a very natural result if the above surmise is true.

The warning here given, though not expressed in gardening terms, will be understood by those who cultivate the plant for profit, and who will, no doubt, benefit by the hints. As an illustration of the quantity of Vanilla sometimes shipped in one consignment, it may be stated that in November last one shipment from the Seychelles amounted to 21,267 kilos, of which 12,386 kilos went to Marseilles, and 8,881 kilos to London. The exports from Tahiti during 1900 amounted to 162,636 lb., of the value of £32,132—no small sum to be added to the finances of the island.

Chillies and Vanilla, to which we have referred, are only two items in the immense returns that flow into and are distributed from the great city markets included under the generic name of Mincing Lane. At another time I hope to refer

to other products of equal value and interest. JOHN R. JACKSON, Lympstone, Devon.—*Gardeners' Chronicle*, March 22.

WOLLD'S PRODUCTION AND CONSUMPTION OF COFFEE.

The French Consul in Brazil, in a report on the state of trade in that country, states that there is an over-production of coffee throughout the world, and that in Brazil there is a tendency to restrict the area of cultivation. He says that in the year from July 1, 1900, to June 30, 1901, the total production of coffee throughout the world was 15,460,000 bags of 132lb. each. and that of this quantity 11,500,000 bags were grown in Brazil, 1,150,000 in Guatemala, Costa Rica, Mexico, and Nicaragua, 1,050,000 in Venezuela, Colombia, Ecuador, and Peru, 480,000 in the Dutch Indies, 450,000 in Hayti, 315,000 in British India and Ceylon, 200,000 in Puerto Rico and Jamaica, and 90,000 in Padang. He estimates the consumption at 14,117,620 bags, leaving an excess of production at 1,342,380 bags.—London *Times*, April 7.

SUGAR CULTIVATION IN FIJI.

An important feature in the sugar industry of Fiji is the cultivation of cane by Indian coolies who have completed their term of indenture. At Rewa they cultivated, during 1900, 1,077 acres, producing 18,399 tons of cane, valued at £9,473. At Navua they cultivated during the same period, 1,921 acres, producing 24,087 tons of cane, valued at £12,516. During the last three years Government has acquired, under the Settlements Fund, certain blocks of land, aggregating 6,790 acres, which have been divided into small holdings, and considerable areas have now been leased at a nominal rent to Indian immigrants whose terms of indenture have expired with a view to inducing them to remain in the country. The annual rental at present obtained from the blocks leased aggregate £234.—*H. and C. Mail*, April 11.

WILD ANIMALS IN MADRAS.

The number of wild animals destroyed in this Presidency during 1900-01 was 1,015, or 41 more than in the previous year. Of tigers killed there were 105, or 16 less than in the previous year, but of panthers, leopards, and cheetahs killed there were 829 accounted for, or 55 more than in the previous year. As usual, Ganjam and Vizagapatam contributed the largest number of animals killed, the figures being 209 and 257 respectively. The rewards disbursed during the year amounted to R20.761, against R19,548 in the previous year. The loss of human life caused by wild animals was as high as 203. It was heaviest in Vizagapatam, where 71 persons were killed. The number of cattle killed was 15,197, the heaviest mortality being in South Canara (4,628).—*M. Mail.*

PLUMBAGO MINING IN CEYLON.

As we mentioned in our last issue Capt. Tregay, the well known mining expert, leaves Ceylon by the mail steamer "Orizaba" on Thursday after 4½ years' residence in Ceylon, having been here since 1897 and spent most of his time on Monerakande whilst also visiting various parts of the island for plumbago mining purposes. "I have had considerable experience in mining generally" said he to our representative, "and my opinion most decidedly is that there is a good deal of money to be made out of plumbago, if sufficient funds are provided for deep mining. The fact of the matter is that I am going home now with the object of floating one or two companies to take the matter in hand. Most of the surface plumbago has already been exploited and what we want to do is to mine deeper with proper appliances. The deeper the mining, the better the quality and therefore the better the price. High prices, of course, always stimulate prospecting and this was overdone during the boom 3 or 4 years ago. The present prices are sufficient to encourage prospecting on legitimate lines. There is not much new ground to open up but there is plenty of ore below present workings which can be reached with proper appliances to go to great depths. What I mean by proper appliances is superior pumping and hauling machinery; nothing else is required but good management. Most decidedly I believe there is money to be made out of plumbago, if it is properly worked. All you want is a proper system of working and there does not seem to be any system whatever in the native way of working. You want really to get down to the primary rock. What I say is that you may get plumbago at practically an unlimited depth. The greater the depth the better the price. There is a large export from Ceylon just now, but honestly I believe it is from stock and that the production is not keeping pace with the consumption."

PROFESSOR HERDMAN'S RESEARCHES.

(To the Editor of the *Daily Post.*)

Sir,—The enclosed letter from Professor Herdman reaches me abroad, hence delay in transmission. Although more specially intended for his biological friends, it is of such interest as to deserve the wider publicity through your columns, and forms the fourth of the series.

The experiment of the drift bottles, thrown overboard *en route* down Channel as a clue to currents, has proved even more successful than anticipated and form a most valuable sequel to previous experiments made in the Irish Sea.—Yours, &c.,

ISAAC C. THOMPSON.

Mentone, April 3rd, 1902.

———

S.S. "Lady Havelock," off Chilavaturai Pearl Fisheries, Gulf of Manaar, Feb. 28th, 1902.

My Dear Thompson,—I have just heard from our Fisheries Department at University College of the success of the drift-bottle experiment which we started the night we left Liverpool. Perhaps Mr. Johnstone has given you later information than I have, but within a month from the time they were set free 120 out of the 200 drifters had been returned, and they were practically unanimous as to the story they told about the currents.

Mr. Hornell and I have now been here about six weeks, and have finished the first part of our work, which was a general survey of the marine zoology of the Ceylon coast, and have started the second part—viz. a detailed study of the pearl oyster banks in the Gulf of Manaar. For this work we have our dredging steamer the "Lady Havelock," a smaller steamer the "Serendib," and two large sailing barques, on one

of which we have laboratory and tanks, while the other accommodates the divers and other natives. With the numerous native and ship's boats added, we make a flotilla such as, the Inspector of Fisheries tells me, has never before been seen in this out-of-the-way place.

The general marine fauna here is very rich, and we get up, either by means of the divers or by dredging, new and interesting specimens every day including many cases of commensalism and of protective colouration. We are also getting a good many new facts about the pearl oyster which will, I hope, enable us to make a useful report. But I don't intend to tell you anything about our oyster work except in most general terms, as we shall not come to any conclusions until we have all the facts before us. With our numerous divers and facilities for dredging and trawling we are making a most thorough examination of the ground, and as you know well, in a biological problem of this kind, the whole of the rest of the fauna—both bottom and surface—may have to be taken into account. We are, of course, taking frequent tow-nettings at different depths and times of the day, and I am trusting to you to work the Copepoda out for me, which will be a help in determining the food necessary for the oyster, as we find some Copepoda in its stomach. There are a great many water snakes here. It is striking to find animals like these of terrestrial origin so far out at sea as we do. We have caught and dissected a considerable number. They have been said by the divers to eat the pearl oysters, but we can find no evidence of that from their stomachs. Their food, so far as we have seen, is entirely small fishes. Part of my work is to report upon the most suitable spot for a small biological station. This has necessitated visits to several little-known parts of the coast. Between two trips lately I had a couple of days to spare, which enabled me, along with Mr. Willis, Director of the Botanic Gardens, to go up Adam's Peak, a very interesting climb. We were on the top on the night of full-moon, and found about 500 pilgrims worshipping at the shrine of the sacred footstep—a motley crowd. We had a perfect sunrise, and the famous shadow of the Peak was well shown.

We have seen no sharks yet at the pearl fishery, although they generally make their appearance. The divers wear charms to protect them, and they also have a shark-charmer, who plays a pipe to keep them away. There is likewise a Goddess of the Pearl Banks who has to be propitiated. She was formerly in prehistoric times an Amazonian Queen of the Cingalese who took such an interest in the pearl fishery that she sat all day on the northern end of Karativue Island, watching the divers. Now Karativue is at present at least twenty miles to the south of the pearl banks, which must be discouraging to the believer unless the Queen had remarkable eyesight; but there is a shoal upon which we have been dredging and which extends from the end of Karativue up to within a mile of where we have found the pearl oysters, and it is highly probable that that shoal was formerly part of the island—which establishes at least the possibility of the ancient story. The Queen like the northern part of her island is now beneath the waves and the pearl divers believe that she is still watching them. I hope that this will reach you in time to give my remembrances to the biologists at the April meeting of the Society, and I hope to be with you at the May meeting.—Yours ever.

W. A. HERDMAN.

THE RENOVATION OF TEA ESTATES.

(By an old Planter.)

Although a considerable number of gardens in the Surma Valley have covered their expenses and declared dividends, the sums carried forward indicate that dependence upon accommodation, either from banks or agency houses, has still been resorted to for tiding over the unproductive months; thus very few properties at the present time of writing are unencumbered with debt, and recent accounts show that over a very large area the first flush has well nigh been annihilated by hailstorms of unprecedented violence. Considering the overstocks that must be locked up in the Continent, and the dwindling down of the shortage to less than one-fourth of what it was estimated to be in August last, the ripping visitation may be regarded as a blessing in disguise; for there is reason to believe reduction in output has not been so loyally observed as those who professed to have adopted it wished their neighbours to believe,—the statistics proving the allegation. * * * The lighter soil in Sylhet and Cachar is exhausted, and though persistence in keeping up estates which yield but meagre returns (that cannot really be considered legitimate profits) may suit the views of certain interested parties who alone benefit, the hopes of shareholders grow fainter every successive season. * * * The chief need of the tea plant is ammonia, which by enriching the sap gives extra strength to the leaf, which sales show the Surma Valley teas are deficient in; phosphates develope wood and fruit, corresponding to bone and muscle, but as the ordinary run of our plants are tolerably well supplied in this respect, when not knotted and gnarled by the now fortunately obsolete system of pruning; the bone meal vended does not contain a sufficient proportion of ammonia to bring our leaf up to the mark; an undue amount of the alkali would prove detrimental, but 25 per cent. is certainly required, so that agents might well put themselves in communication with the local gas works upon the subject. Were it feasible we are inclined to recommend one-fourth ammonia, one-fourth fine-ground bone dust two-fourths compost of well-desiccated weeds, dead leaves and other vegetable matter, or bheel soil procurable from such places as are inundated by mountain streams. The proper shape of the renovating pits will suggest themselves to most people, which may be wedge-like, the base being toward the root of the plant, such with the contents well stamped down as much as possible, to prevent evaporation of more volatile gas would have a lasting effect over three or four years, while simple top dressing, even when forked in, wastes its constituents up on the empty air. * * * More remunerative prices must be obtained, for the cost of production has reached its limits; and the carryings forward are neither sufficient to meet cold weather expenses nor clear off any appreciable amount of the debt the majority of plantations are labouring under, still less yield any return to the investors. Mr Mann's whole attention should be directed to the subject of manure; we do not require analysis of soils, which everyone knows have long since parted with whatever productive properties they may have at the outset possessed. Few, even if they have the land, can afford the expense of extensions, which will return nothing for four years, and a good number by ill-advised relinquishments have brought their whole available area under plant. The only hope therefore lies in renovation; the alternative we need not dwell upon. Rule of thumb planting must now give way to systematic gardening, which ultra-conservative orchard owners have at length realized in England. This, combined with curtailment in production, may yet bring the Surma teas up to the 9d., otherwise estates must be thrown up. For though many of the adjuncts or substitutes to tea, suggested *ad nauseam*, promise better results, it has to be remembered that these will not thrive upon exhausted soil, though there are a number of people who in discussing this matter are wont to express a different opinion.—*Indian Planters' Gazette*, April 19.

TOBACCO IN CENTRAL AFRICA.

As the writer was anxious to know definitely whether tobacco should be fermented or not before exporting, the small sample submitted was unfermented.

The report is as follows :—"In the present condition of the sample of Zomba-grown tobacco, it is quite impossible to denote for what it is suitable. There is little or no flavour of tobacco in it, and evidently it has not been properly fermented.

We presume this is the result of the first attempt to grow tobacco for the London Market and from the general appearance we should think that, with proper expert supervision, a merchantable article could be produced.

The tobacco should be fermented before it is packed."

From the report it would appear that all that is now required to place a good tobacco on the London Market is expert supervision. This is undoubtedly where the whole tobacco question hinges. It has been the critical point in tobacco-growing in other countries as well as B C A, and expert curers have been obtained from America to manipulate the tobacco for the London Market; but can B C A go in for expert curers? From enquiries made in America it is ascertained that the salary of an expert curer for B C A would be over £1,000 per year. It is almost impossible to think of an expert curer being obtained for B. C. A. until a big business is done in tobacco-growing: then, the community might combine for the services of an expert.

The time is scarcely ripe to engage an expert at present, owing to the small quantity of tobacco grown, and the industry being only in the initial stage of development.

Under the present circumstances it may appear disappointing, and to some perhaps a waste of time and labour to grow tobacco; still it would be a great mistake that there should be any hesitation to cultivate such a valuable product because of the difficulty met with in its curing.

It certainly is a delicate matter to manipulate tobacco to its proper condition, but it is within the range of all to do it; and, considering the suitability of the climate, the cheapness of labour, and the great demand for B C A tobacco in Southern Rhodesia and South African markets, the curing of the crop should be persevered in until a commercial article of good quality can be produced.

Since the receipt of the London Chamber of Commerce Report, about half (nearly 250 lb) of the tobacco grown at Zomba last season has been experimentally fermented, and from the experience thus gained it is hoped that some progress may be made towards successful curing. The bulk now made up is of leaves that were first cut from the stalk, and dried in an ordinary grass shed. A second quantity now being fermented is of leaves that were dried on the stalk, in a grass shed with free circulation of air.

It is too early to say anything definite regarding the quality of the first experiment, but the result is certainly encouraging. It has shown where mistakes occurred in the manipulation, from the time of cutting in the field.

A special highly graduated Hygrometer has now been received for the purpose of fire (flue) curing,

Should anyone be desirous of curing their crop in this manner, every assistance will be given them from this office as far as it is possible.

J. McCLOUNIE,

Head of Scientific Dept.

British Central Africa Gazette, Feb. 28.

POULTRY CULTURE IN FRANCE.

ARTIFICIAL INCUBATION ON A BIG SCALE.

In the last report of Consul-General Inglis, of Paris, an interesting account is given of the method adopted in France in poultry culture, and a description of the artificial incubation which has for many years past been conducted on a large scale, particularly at Gambais, near Houdan, on the Paris-Granville line, about 31 miles from the capital. At this place there is a practical school of aviculture, which was instituted in 1883 by a decree of the Minister of Agriculture, and it is in the centre of the poultry-farming industry, Houdan itself being renowned for its breed of fowls, the favourite description being Houdans, Crèvecœur La Flèche, and Faverolles. The Bresse, another breed—a cross between the Andalusian and common fowl—is bred extensively about Bourg, and gives the renowned "Poularde de Bresse." The School of Aviculture at Gambais enjoys a high reputation, and pupils of either sex are received. Candidates must not be under the age of 15, and must have received a certain amount of general instruction, such as would entitle them to a certificate from the primary schools. The terms are £14 for a three months' course, including tuition, board, and lodging. On leaving the school, pupils who have shown capacity to act as instructors in aviculture, received a certificate of competency, which, it is said, enables them without difficulty to obtain employment in this line of industry. In connection with the system of artificial incubation which is practised at the school, it may be said that the incubators and other appliances are more or less the invention of the original founders. Heat, moisture, and aeration are the principal factors in the process of incubation. The heat is now arranged so as to come from above, and, being thus directed on the entire surface of the drawers in which the eggs are arranged, is more evenly distributed, and it is claimed that the eggs, by receiving the warmth from above, are in this respect in the same condition as if under the hen. Regular aeration is obtained by pipes running along each side of the apparatus, and an outlet at the same time secured for the carbonic acid disengaged by the embryos. The requisite degree of moisture is ensured by taking advantage of the difference between the temperature of the drawers and that of the surrounding atmosphere, the two currents being brought into contact by the lateral pipes already referred to; a moist vapour is the result, similar to that observable on the windows of a room in winter.

THE NEW HYDRO-INCUBATOR

used is capable of accommodating from 200 to 500 eggs, the price of the apparatus ranging from £6 to £12, the latter including drying-box. Heating is now effected by a small briquette of compressed brick dust, which burns slowly from 12 to 14 hours, according to dimensions. To heat an incubator of 250 eggs it is said that three-fourths of a briquette, costing 1½d, is sufficient for 12 hours. The danger of fire inseparable from the use of a lamp is thus eliminated, since the briquette is placed out of harm's way in a specially-arranged chamber. An incubator of 60 eggs requires about 20 briquettes, one of 130 eggs 25, of 250 eggs say 35. The eggs having been placed in the incubator in the morning, the drawers are not opened until the evening, and then only for three or four minutes; the next morning the temperature is taken, the drawers are removed, and the door is then closed; the eggs are turned over and their places changed, so that the eggs which were in the centre are now at the sides of the drawers; they are thus made to

occupy alternately the warmer and cooler parts of the apparatus, and are never twice in succession in the same place or on the same side. An ingenious contrivance has been devised for effecting this operation, which, however, does not appear to require any great expenditure of time, as it is said that as many as 290 eggs can be turned in five minutes, or in ten minutes by an inexperienced hand. After the lapse of ten more minutes the eggs are returned to their places, having been out a sufficient time, if it is summer, for aeration and cooling; the water is then re-heated, or the briquette replaced in the apparatus; the whole then remains undisturbed until 7 p.m.; the doors are, however, opened at 1.30 p.m., and the eggs are gently fanned so as to renovate the air, thus also imitating the hen flapping her wings; at 7 p.m. the temperature is taken, to see if any water has to be drawn off and replaced by a further supply. The eggs are then once more turned and their places changed, as in the morning, and the whole is at once closed. Such is the procedure during the whole period of incubation. To recapitulate:—(1) Temperature 39° to 40° (Centigrade) during the course of incubation; (2) re-arrangement of the eggs, as described, morning and evening; (3) maintenance of the temperature by the addition of boiling water, or of the briquette, and (4) testing the eggs. With regard to the last item, it is estimated that in dealing with a large number of eggs,

SOME 20 TO 50 PER CENT. ARE STERILE,

hence the necessity of testing. This is done on the fifth day (120 hours), a special lamp tester being employed for that purpose, for the operation must be performed in a darkened room. In this case, the light is placed at a height of about five feet, the egg being held with the fingers of the right hand, the large end uppermost, while the left placed over the egg acts as a shade. A practised eye can then readily distinguish the fertile egg. After 120 hours in the incubator, if fertile, the yolk is seen to be dilated, forming a semi-circle shaded at the base. The embryo is seen in the centre, and resembles somewhat a spider, the legs of which are represented by the blood vessels, now plainly apparent in proximity to the embryo, and increasing in distinctness as they approach the perimeter of the egg. If the embryo is alive, it oscillates from right to left, from the bottom upwards, every time the egg is moved. If on the other hand it is without life, the vessels are dull and ill-defined, and the embryo will be seen clinging to the sides, and remains motionless, having the appearance of a spot of ink. Before being placed in the incubator, eggs are also tested as to freshness. The air chamber is barely visible on the first day, but goes on increasing in dimensions. Eggs should not be more than a week old. They are collected in boxes with partitions, so that each egg is in a separate compartment and cannot receive a shock or get cracked. They are then placed in a box and covered with bran or dry sawdust. Shaking caused by conveyance in carts or by railway is prejudicial; it cannot, however, always be avoided and in these cases the eggs are laid on grain, in a cool, dry place, for 24 to 36 hours. Fertile eggs cannot be recognised until after five days' incubation. The 21st day having been reached, the drawers of the incubator are opened at 7 a m and the temperature noted as usual; the chirping of the young brood will now probably be audible. Eggs not hatched out are, however, turned as usual, any shells showing signs of perforation being placed with the perforated side uppermost, so that the young chickens may more readily breathe. Chickens already hatched out are now transferred to the drying box. At noon the incubator is again opened, and the operation proceeded with as before, the chickens being covered with a soft woollen cloth in summer, and with a small eider down in winter; the more numerous the brood the less susceptible will they be to cold. The young birds are never helped out of the eggs, except perhaps when one adheres only by a few strands of membrane. If the chicken is assisted to emerge from the shell there is every danger of the blood vessels being lacerated and the loss of a single drop of blood at this stage is, it is said, sufficient to cause the death of the chicken in from three to four days. The drying-box is prepared with a layer of soft straw or hay, barley straw being preferred; 40 to 50 chickens are placed in it and covered as already described. The next day they are brought out into the open compartment; but at this stage no food is given. After being out for from five to ten minutes they are restored to the box, to be taken out again two hours later. This time they are given a few crumbs of very dry bread. After a day in the drying-box, they are transferred to the artificial mother or breeder; two of these suffice for some 450 chickens. During the first week they receive constant attention; on the third or fourth day they are given some liberty, being let out into an enclosed space a few yards square, but the moment they show signs of chilliness they are driven back under the protection of the breeder. The food during this early period consists of a paste made of barleymeal and milk, sufficiently consistent to adhere to the wooden billet employed for that purpose. Instead of waiting, as is usual in the Bresse and Maine, until the birds are from six to eight months old, at Gambais the operation of fattening for the table begins as soon as the pullets have reached the age of three-and-a half months. Cages containing fifty birds are arranged along the walls of the building devoted to this purpose, which is kept warm in winter, and, as far as possible, cool in summer. The floor of these cages is covered with a thick layer of straw, which is renewed every morning. Three meals are given every day for a fortnight. The first consists of a lukewarm liquid mash, composed of barley meal and water; the second is the same; but for the third the mash is made with milk or "petit lait." The latter is the milk running from cheese in process of manufacture, and fetched in barrels from the manufactories. At the end of a fortnight the fat begins to make its appearance. In order to give the finishing touch, a small quantity of lard is now given to each bird at each meal. This is continued for four or five days, when the bird will be so fat that, if the *régime* were maintained for two days more, it would inevitably succumb. If it is sought to attain the extreme limit of perfection, for the last three days eggs are added to the mash in sufficient quantity for each bird to have at least one per day. The food is given by means of a funnel specially made for the purpose. Two persons, it is said, can thus dispose of sixty fowls in an hour, one in a minute.—*Journal of the Society of Arts*, April 11,

TO THE PLANTING WORLD.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis.—Orders being booked for the coming crop August-September delivery 1902, booking necessary before the end of April, quantities of 100,000 and over at special low rates. Plants available all the year round, 100,000 and over at special low rates. A leading Rubber planter in Sumatra, who purchased 50,000 seeds in 1899, and 100,000 in 1900, writes us, under date 15th November, 1900:—"I received your letter of 20th October, from which I learn that you added another case of 5,000 seeds to replace the loss, &c. I am satisfied hereby, and even after this adding I am satisfied by the whole delivery of this year." Special offer, post free on application.

Castilloa Elastica.—True superior variety cultivated in Mexico, seeds from specially reserved old untapped trees. Orders booked for August-September delivery 1902, immediate booking necessary; large quantities on special terms; Plants in Wardian cases.

A foreign firm of Planters writes under date 11th October, 1901:—"We beg to enquire whether you would procure us 100,000 Castilloa seeds, in which month we might expect them, and what would be the average price." Special offer, post free on application.

Manihot Glaziovii.—Seeds and Plants available all the year round, 100,000 and over at special low rates. A Mexican planter in sending an order for this seed wrote on the 22nd August, 1900:—"If they arrive fresh and germinate easily I may send you larger orders, as they are for high ground where the Castilloa does not thrive."

Ficus Elastica.—Seeds available in May-June; booking necessary before the end of March; also plants.

Mimusops Globosa (Balata) wood of the tree is much sought for buildings, fruits sweet like a plum and eaten, oil from seeds, said to yield as much as 45 lbs. of dry rubber per tree per annum, the milk is drunk and when diluted with water used as cow's milk, grow from sea level up to 2,000 feet, orders being booked for seeds and plants, price on application.

Cinnamomum Zeylanicum (Cinnamon superior variety).—New crop of seed in April to June; booking necessary before the end of February; also plants.

Coffee Arabica, Liberian Hybrid and **Maragogopie Hybrid.**—New crop March-April; immediate booking necessary.

A foreign Agricultural Department writes dating 9th September, 1901:—"Please accept our order for 175 lbs. of Tea seed and for 2,000 Coffee beans. In regard to Coffee seed I would say that this will be the first importation made by this department, and we will leave the selection of the varieties to be sent to your judgment."

OUR DESCRIPTIVE PRICE LISTS.

The following six Descriptive Price Lists are now being forwarded with Circulars and special offer of Seeds and Plants of Rubber and other Economic Products:—

1. Tropical Seeds and Plants of Commercial Products, enlarged edition for 1902.
2. Seeds and Plants of Shade, Timber, Wind-Belts, Fuel, and Ornamental Trees, Trees for Roadsides, Parks, Open Spaces, Pasture Lands, Avenues, Hedges, and for planting among crops (Tea, Coffee Cacao, Cardamoms, &c.)
3. Seeds and Plants of Tropical Fruit Trees including Mango grafts.
4. Bulbs, Tubers and Yams.
5. Orchids—Ceylon and Indian.
6. Seeds and Plants of Palms, Calamus, Pandanus, Cycads, Tree and other Ferns, Crotons, Roses, Dracinas, Shrubs and Creepers.

Special Arrangements made with foreign Governments, Botanical and Agricultural Departments, Planters and others for supplying seeds and plants of Commercial Products in large quantities.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by WILLIAM BROTHERS, Tropical Seed Merchants of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbling. We recommend the great Powers and Concessionaries under them to go to William Brothers."

Agents in London:—MESSRS. P. W. WOOLLEY & Co., 90, Lower Thames Street.

Agent in Colombo, Ceylon:—E. B. CREASY, Esq.

Agent in British Central Africa:—T. H. LLOYD, Esq., Blantyre.

Telegraphic Address:
WILLIAM, HENARATGODA, CEYLON.
Liber's, A.I. and A.B.C. Codes used.

To the Editor.

TEA IN AUSTRALIA:

CUSTOMS INSPECTION AND "COOLIE" VERSUS WHITE MAN'S PACKING.

Melbourne, April 9.

DEAR SIR,—Since writing to you last I have been able to ascertain that the supervision of tea at the Customs will be much the same. The Health Officer still exercises the same power, but unless tea is absolutely unfit for human consumption, I believe, the quality passed may be very low. The prominent aspect of the subject, in fact, seems to be the prevailing impression that an inferior description of tea will now be foisted on Australia. It is therefore for Ceylon to look to what tea is sent here, and be careful never to have her name associated with any of the scandals which are predicted to crop up at the Customs here ere long as stocks diminish. You are doing well in urging this, in season and out of season, particularly at present, as I have noted that *Ceylon* is chiefly aimed at, in a mass of letters which have been appearing in the local press, in regard to what they call "the grave injustice done to Australian tea packers and blenders by the cancellation of the duty on packet tea."

The Labor members are much blamed for their oversight, in what was undoubtedly *their* move, and though I do not think you need anticipate any alteration of the *free* decision in regard to *bulk teas* in the Senate, I am so imbued with the feeling that the Barton Government is under the thumb of the Labor Party that, if the packet people once get the Ear of Trades Hall, "Coolie packed tea" will soon cease to be on the free list. I enclose you some letters and send papers on this and other political aspects.—Yours faithfully, ONLOOKER.

The Australian tea importers find their interests have received little consideration at the hands of the representatives in the Federal Parliament. The abolition of the duty places them in a very uncertain position, whilst it entails a heavy loss on their duty-paid stocks. One section of the tea trade will benefit materially, and that is the retailer. Possibly the consumer may get a tea better by 1d per lb. for his 1/3 or 1/ today, but an additional 2d per lb. profit goes into the pockets of the distributor, which is very much to his liking, notwithstanding all Mr Watson's talk. Neither that gentleman nor his friends know much of the trade, and in their efforts to get a free breakfast table have played into the hands of a small section of the community, which will absorb almost the entire remission in duty. The tea packers are in a worse position. All the rubbish which is packed in Ceylon and Indian markets, to which attention was called some time back, will now find its way to Australia, and the coolie will oust the local white packer from his employment and thus fill the ranks of the unemployed. The Labour leader in the end will probably be cursed by those whom he thought he was serving. Packet tea should by all means be dutiable, and it is regrettable that Ministers did not recognise the urgency of the situation with as much readiness as they have shown in other directions by bringing down recommittals for favored industries.

TEA IN PACKETS.

From time to time the grave injustice done to Australian tea packers and blenders by the cancellation of the duty on packet as well as bulk tea has been pointed out in "The Age," yet singularly enough none of the supporters of local labour has stirred a finger to place a small protective duty on the former, made up by coolie labour and packed in wrappers, &c., which have no duty. The question of packet tea must be kept altogether apart from bulk tea, which the House has in its wisdom or otherwise made free. The total quantity of tea imported into Australia annually is estimated at over 30,000,000 lb., and of this quantity it is computed that more than 20,000,000 lb. are sold in ½ lb. to 12 lb. packets, employing local labour. The result of the Federal Government's decision has been to endanger this industry, and coolie-packed teas are being ordered freely. Under the proposed tariff a protective difference of 1d per lb. was made between duty on bulk and packet teas. The trade in Melbourne, Sydney, Adelaide and Queensland are all protesting against the action of the Government, the Melbourne petition reading thus:—

Melbourne, 10th April, 1902.—In drawing attention to our cause, we wish to give assurance that the question of whether tea ought to be free or bear a duty does not form one of the points of our contention. Until recently the different tariffs existing in the various colonies served to make these markets so small that they acted to some extent as a protection to the local tea packers against aggressive competition from the employers of Asiatic labor, but latterly even then it was becoming apparent to us that the cheap black labour must in the end beat us out. With the inauguration of the Federal tariff, our market became one easier for our opponents to work; and we fear, unless some assistance is given us, the disadvantages under which we labour will compel us to remove our packing operation to where we can take advantage of this cheap labour. At the present time there are here representatives from Ceylon canvassing for orders, and using as their main argument that they can undersell locally-packed teas, because of the advantages they have of cheap labour, and that they avoid payment of duty on the materials used in the containers. We pay white men's wages, which is estimated to be about 1/ to every penny that colored labour costs for similar services. In addition to this almost every article we use in our business of tea packing is subject to an import duty, whilst those who compete against us have no such handicap. Wrapping paper, twine, printed matter, timber for cases, weighing machines, scales, dynamos, gas engines, blending machinery, starch for paste making, &c., are subject to duty, and these are the principal items in use. We therefore feel justified in asking that some counter-vailing duty be imposed on all packages of 12 lb. and under containing tea.

CACAO IN THE WEST INDIES: THE WITHERING OF YOUNG PODS.

Trinidad, B.W.I., 9th April, 1902.

SIR,—I noted in your January issue that the author of the article on cacao diseases said that information on the withering of young pods would be acceptable. I gathered some such information some time ago in response to questions which I sent to several planters and managers

in the colony, being anxious to know why there was so much waste of plant energy and to find a remedy. I send herewith four sets of answers and also the list of questions put.

No. 1 is a Manager in Tobago, a neighbouring island, famous for the richness of its soil, and that may account partly for the small percentage given in answer 2.

I regret to notice so little reciprocity between those who live on the estates and those who work from a scientific point of view for the benefit of the former class. Hoping I am not intruding on your valuable space.—I remain, yours faithfully, W. L. (CURATOR.)

CACAO.

1. What difference is there between Cacao Trees (a) under dense shade; (b) under normal shade c) under no shade?

And how is the crop, the number of flowers, the growth, and the amount of disease—especially the drying up of young pods—affected by the above conditions?

2. About how many per cent of young pods wither or dry up on healthy full-bearing trees?

3. Is there a distinct difference in such percentage from trees on poor soil and those on rich soil?

4. Do young pods usually dry up in bunches, *i.e.* all on one cushion?

5. Do all young pods except one or two sometimes dry up on one cushion and those remaining become good mature pods?

6. Where only one, two or three young pods appear on one cushion, do these usually develop into good pods?

7. Are some parts of the tree more subject to pods drying up than other parts?

8. In what way is the drying up of young pods affected by the weather? And is there more drying up of young pods in or just after an abnormally wet season or an abnormally dry one?

ANSWERS TO QUESTIONS ON CACAO.

1.—(*a*)—Under dense shade pods rot from too much moisture; (*b*) under normal shade the largest percentage come to perfection; (*c*) under no shade—except in sheltered valleys—pods wither and dry up.

2.—About 12 per cent of pods dry up.

3.—Decidedly in favour of rich soil.

4.—No.

5.—If carefully thinned, those remaining come to maturity.

6.—Yes, and this is what is most desired by the cacao planter.

7.—Yes, trees not pruned early into shape will bear those pods on the superfluous branches.

8.—Pods do not dry up in ordinary weather, but a heavy downfall of rain has a destructive effect on flowering trees, and very young pods. Under the most favourable situation and cultivation, those dry pods will be seen.

The answers to these questions depend largely on climate, soil, and district or situation.

1.—(*a*)—Cacao trees under dense shade generally grow to be long and thin, and they are more likely than otherwise to be affected by disease. During wet weather lots of flowers come out and pods form, but they get rotten and wither. (*b*) Under normal shade, such as Immortal trees at 36 feet apart on the Vega, the trees are in their glory, they will grow uniform and healthy. (b) They will give their full crop of 15 fanegas (average) per thousand according to season. (*c*) Under no shade, the crop is practically nothing during a dry year. During the wet months the trees throw out promising young shoots, but during the dry months these seem to burn and dry up.

2.—Fully 95 per cent wither. When it is taken into account that even on estates yielding 10 bags (of 165 b each) per thousand trees, the average yield per tree is 20 to 22 good pods, it is plain that an enormous number must wither.

3.—Little difference, because trees on poor soil throw out fewers flowers than those on rich soil.

4. 5 and 6. One, two, three or more pods often come to maturity on one cushion, which originally had many more young pods, which withered before maturing. In many instances, however, all the young pods on a cushion will dry up.

7. Given a healthy tree, properly pruned, there is no part of that tree more subject to pods drying than other parts.

8. A prolonged season of drought after a season of rain causes a very large percentage of young pods to dry up. Also if after dry weather we experience heavy and continued rains, the young pods seem to become, as we say, "seized" and rotten. On the flats or lowlands more pods wither after an abnormally wet season than after a dry one, but in the hilly and undulating districts many more wither after an abnormally dry season than after a wet one.

1. (*a*) Slow growth; very small crop; nearly all flowers and young pods die; few flowers; disease frequent. (*b*) Quick growth; crop large and regular as a rule; flowers plentiful; disease not frequent. (*c*) Slow growth; very small crop; few flowers; flowers and young pods destroyed by exposure; disease not frequent.

2. About 80 per cent.

3. The percentage must be much the same, as trees on poor soil have proportionately fewer young pods.

4. Yes.

5. Yes.

6. Yes.

7. I do not think so.

8 The drying up of young pods is equally affected by excess of damp or heat and also by high winds, but if the land is hilly it is not affected to any great extent by either excess.

1. (*a*) Trees appear healthy, but develop very little fruit. (*b*) Trees put out more blossom and develop a higher percentage of fruit. (*c*) Under no shade, or on poor dry soil, it would be impossible to grow a tree to bear fruit; on good soil in deep gullies or ravines a fair crop could be obtained without shade.

2. At least 25 to 35 per cent.

3. Percentage higher on poor soil.

4. No, the weakest ones throughout the trees dry up.

5. Yes.

6. Yes.

7. The lower parts of old trees and the upper parts of young ones.

8. Both extremes favour the drying up of young pods. As alternate showers and sunshine seem to be most favourable I prefer very wet weather to very dry, for in the latter, not only do young pods dry up, but those approaching maturity fail to ripen properly.

TEA IN THE UNITED STATES: WILD SPECULATION.

Fairfield, Lindula, April 15.

DEAR SIR,—I think the enclosed cutting from an American paper will amuse some of your readers. Who can Harold Weddle be? The Dr. Shepard mentioned must be a *very* sanguine man—in addition to being "an enthusiast and benefactor."

Of course, we poor planters have not the advantage of possessing "Dragon's food" jât tea; but many of us own China tea of similar sorts and we will kindly supply the worthy Doctor with an unlimited amount of seed from the same and will label it "Dragon's food" or anything else; or I fancy he could save himself the trouble of opening land in Carolina by purchasing the source of wealth as

above here—and—when he is tired of losing money over the "benefactor" businesss—he could start an oil factory to work off surplus seed.—Yours faithfully, T. M.

TEA CULTIVATION IN SOUTH CAROLINA.

Harold Weddle of London, Eng., visited a number of South Texas points last week on a tour of inspection to determine the adaptability of the soil for tea growing. He is largely engaged in tea culture in Ceylon and India. Through the experiments made in South Carolina he recently became interested in America as a possible tea-growing country. Speaking of the experiments in South Carolina, he said:

"An invitation was recently extended me to visit Pinehurst tea estate at Summerville, S C, by Dr Chas. Shepard, the proprietor, who is experimenting with the possibility of tea culture with the aid of the United States Government Department of Agriculture. Summerville is situated 22 miles from Charleston, S C, a most delightful spot surrounded with lofty pine trees. The soil is admirably adapted for tea growing, being rich and loamy. Dr Shepard has found that tea can be grown in America, but admits that better results could be obtained further south, where more even temperature predominates, less disposed to sudden changes, and where the thermometer does not reach below 25 degrees Fahrenheit. Pinehurst is divided into several sections of tea growing, owing to experiments in the seed obtained from India, Ceylon, China and Japan, both hybrid and indigenous. The best results so far obtained are from Darjeeling seed, a hill region of India. But excellent results have been obtained from seed which the United States government procured from a celebrated tea estate in China, known as Dragon's food, where the tea is never exported, being entirely consumed by wealthy Chinese. The tea bushes are grown to a height of about four feet and are vigorously pruned and all the soil is sub-drained. Dr Shepard is an enthusiast and benefactor to his countrymen in undertaking so thorough a research in tea cultivation. His motives are purely for the advancement of scientific discovery, without pecuniary gain to himself. And the United States department of Agriculture, Realising this, offers every possible aid to facilitate him in furthering the industry.

"The main difficulty now that is to be overcome, to bring the cost of production on a basis of competition to meet foreign grown tea, is labour, as the heathen and Hindoos receive wages about equal to 8 cents per diem. However, Dr Shepard has partly overcome this obstacle by the employment of several negro children, who live with their parents on the tea estate. The children are educated and fed, which in turn is another step towards the solution of the negro problem. The children are taught to pluck the leaf and in many ways are well adapted in the tea fields.

"No expense has been spared at Pinehurst in adopting modern machinery for driving and preparing the leaf after it is picked. Having imported from England the very best tea machinery in use in India and Ceylon, Dr Shepard has recently completed a machine of his own invention, whereby green tea can be made without the handling as in vogue in China. Its simplicity appears at once to those understanding the manufacture of tea. There is absolutely no sense in artificially coloring tea green, as it comes from China and Japan. The flavor can be obtaine naturally with the aid of Dr Shepard's machine.

"The cultivation of tea is undoubtedly feasible in America and, if carried on on a large scale and the expense of labor saved, there is no reason to doubt that in course of time it would become a great and paying industry. One of the important facts is that the tea plant lives longer than a human being and can be gathered from when over 100 years old. We begin to gather the leaf at five years old, but Dr Shepard told me that he had so cultivated and grown it that he gathered the leaf, and it was good, after one year."

CEYLON GREEN TEA—GOOD PROSPECT BEFORE ALL KINDS:—No. I.

April 16th, 1902.

Dear Sir,—I want to put before you some facts which go to show that Ceylon Green Teas, as made in estate factories last year and now, are appreciated on their own merits in Canada and even in the States. I rather think, for one thing, that Mr. Lipton's representative could tell you that they are pushing and selling successfully the present make of green tea in the States. As you doubtless know, the tea business of the States is in the hands chiefly of four or five large and very wealthy importing firms who have their agencies in China and Japan, and a good deal of money sunk in these; hence the difficulty in getting in either our black or green teas.

Then during the past month advices have been received from Japan, both independent statements, one private, the other taken from an official report, thus,—"Japan teas are also exported to Canada, but there, I hear, they are being rapidly supplanted by Ceylon produce." "The position of the Japan tea trade in Canada is unsatisfactory in the extreme. The trade in the finer grades of Japan tea has been to a great extent supplanted in Canada by the Ceylon product, and the only demand that exists for Japan leaf is for the commoner descriptions which can be sold at low prices and which are largely used for mixing purposes." "In Canada, however, the Japan tea trade is certainly suffering from the competition of Ceylon teas, and it is probable that, except in the lower grades of Japans, used chiefly for mixing purposes, the Ceylon product will eventually supplant the Japan growths." Export from Yokohama to Canada 1899 7,193,776 lb.; 1901 5,623,366 lb.

In the States they do pay higher prices, and here no doubt Mr. Galt's tea will meet with a ready sale, and if the difference in price paid for these teas and the present Ceylon green is considerable, no doubt they will find many imitators; but their success yet remains to be seen. My own opinion is that there is an opening for both varieties, and you may have overlooked the statement made by Mr. Bois at the Chamber of Commerce meeting on the 25th March quoting from a letter he had received from Japan "the taste in the U.S. is gradually undergoing a change, and the demand for a *pure uncoloured tea is on the increase.* Therefore o

the tea now shipped about 1-3rd is now what it professes to be—pure *uncoloured* Japan teas.

I make a quotation from your columns:—"India has just been advised that a proper green tea should be made there, and not a tea such as Ceylon makes, which is neither 'fish, flesh or good red herring." This, no doubt, refers to your Calcutta telegram of the 4th in which Ceylon is stated to be producing a "namuna" tea; in this your correspondent erred. No "namuna" tea has been made here. This is a black tea, with an outturn somewhat similar to an oolong unscented, and a tea of this description, might be made, so Mr. Foley says, and pushed in Persia, to replace a similarly made tea, obtained from Java.

Is the Ceylon green neither fish, flesh nor good red herring? Possibly not; but this type *is* being made in India, it is finding a good sale in Russia, was approved of in Calcutta when tasted by the Afghan envoy and suite, obtained highest recognition at the Chicago Exhibition in 1893, and has met with satisfactory success in Canada. 'Japan greens' is a misnomer, they are known in the American market as "Japans," and are many-hued, black, brown and various shades of green, grey, blue, &c, Ceylon greens, although uncoloured, are green and become greener the more they are handled.

I see that the Anglo-American Direct Tea Trading Company is stated to do already the largest Indian and Ceylon business in America, and I wish them success in their new venture; but surely nothing should be done at this moment to check the output of the present article, which appears to be steadily making its way, if the price paid is any criterion. Low-country green selling at the present moment at 34 cents and 35 cents average or two or three cents higher than they would get for their leaf made into black tea. I think the future outlook for our greens promising. They are being taken in Russia and other countries beside America, and we know that the supply from Japan is steadily falling off, and likely to continue; labour there is going up in price, and already costs over a shilling a day, or more than double ours. Their tea has also been falling off in quality as well as quantity,—I am, truly yours,

A FRIEND OF ALL GREEN TEA.

No. II:—GREEN TEAS—AND GREEN TEAS.

Stagbrook Group, Peermaad,
Travancore, S. India.
13th April, 1902.

SIR,—Being, of course, greatly interested in Green Tea manufacture, I have read your recent editorials on the subject with interest. That Mr. Galt's experiments in "finishing off" (rather than manufacturing) Ceylon-made greens are so successful, from Messrs. Forbes and Walker's point of view, is certainly encouraging; but a broker is not necessarily a buyer. I had only recently before me samples of Green tea made, I believe, by a Chinaman in a Kangra Valley garden, and though the prices obtained made one's mouth water, viz., R1—2 as; 12 annas and 10 annas per pound, it apparently did not pay, as the manager wrote to me with a view to adopting what I may call my "Ceylon system." The extra cost of panning and coloring made teas must be considerable from my observation of the process in Japan; and it is more than doubtful at present if a compensating higher rate will be given for appearance by our American buyers. As Mr. Galt is aware some of the highest-priced Japan teas are "uncolored" basket fired, and also the coloring is only resorted to by foreign buyers after the teas have reached the Treaty Ports. The finest teas are those made up into very thin squills which, though feasible with "China" leaf, would not be feasible with our large indigenous or Hybrid teas unless the bud and first leaf were plucked separately, a process entailing much extra cost.

I venture to express the opinion that (while it is very desirable to take greater care to obtain a good twist and appearance than is frequently the case), carefully made Ceylons, such as some samples of Dewalakande estate, which I had sent me by Mr Larkin from Toronto, are good enough in appearance for any market; and will push their own way on their intrinsic merit without any artificial aid from "coloring matter"—some teas answering to this description I sold in bond in New York at 22 dollar cents last year. Do I understand you to say that the teas Messrs Forbes and Walker refer to are manufactured in Colombo or are they manufactured upcountry and then manipulated in Colombo? I have great hopes that the machine I am about to place on the market will make the matter of "twist" and appearance a very much simpler one than at present; but meanwhile it will be interesting to know the average cost of production on the "Ceylon" system after adding on the Colombo factory charges, and to also get some idea of the trifling extra capital required to enable one to copy Mr Galt's (or rather the Japanese) system of panning and coloring as done in Colombo, without which we are apparently to be shut out of the American market. I fear much that a "dig" at the Ceylon Commissioner had more to do with the articles under comment than a sincere opinion that Ceylon and India should make the retrograde movement of "coloring" their teas.—Yours faithfully,

H D DEANE.

P.S.—It must be remembered Ceylon made Green Teas took a first award at the Chicago Exhibition without the aid of coloring matter, and I may add that Messrs Frame, Alston and Arbuthnot, of 21, Mincing Lane, and 132, Front Street, New York, writing me on 20th March last say they have just heard from their *Toronto friends* who had just inspected my samples, sent to Messrs P Larkin & Co., the Indian Tea Association, Calcutta, and the Planters' Association of Ceylon, "and consider the quality and manufacture to be both first class."

THE NEEM OR MARGOSA TREE: NO I.

Jaffna, April 22.

DEAR SIR,—As the information given in your valuable paper concerning the neem tree was interesting to some of your readers, I beg to add the following remarks. The tree is indigenous to Jaffna and the northern forests, and is extremely common here. It is known in Tamil by the name of *vembu* or *veppamaram*. Its uses are numerous and

it is worth special mention, at a time when so much is said about malaria and mosquitoes, that the smoke of the husk or shell of the seed is particularly odious to these unwelcome insects. The shell is put into a pot or chatty and allowed to smoke in a room during the mosquito season, and it is believed to be effective in keeping away these insects so long as any trace of the smoke is left. Cattle are made to inhale this smoke in some diseases. It may also be mentioned that the gum which exudes from the tree when the bark is hacked is the best paste that could be obtained locally. Enough has been said about the medicinal properties of the leaves, bark, and oil, and it is unnecessary for me to revert to it again further than to say that the leaves and twigs are believed to have a magical effect in the hands of the class of native physicians or devil-drivers who administer gentle blows with a bunch of them on the affected parts in cases of sprains, swellings, or snake-bites—or all over the body, in cases of so called possession of devils.—Yours truly, A. N.

II.

Kayts, May 1st.

DEAR SIR,—The leaves of the *vembu* tree serve as disinfectants during the time of small-pox and other epidemics. The bark is a febrifuge like the cinchona bark. The twigs are used as toothbrushes in the mornings, the bitter taste promoting appetite. The discovery of cinchona in America has to a considerable extent diminished the value of the *vembu* or margosa tree.

M. T.

RAINBOW TROUT BREEDING IN CEYLON: SOME UNMISTAKABLE SIGNS.

Bogawantalawa, April 27.

SIR,—It will, I am sure, interest all fishermen and naturalists in Ceylon and India to know that the Rainbow trout (salmo irridens) is breeding freely in our upland streams.

On Friday and Saturday last Mr. W A Sparling and myself spent several hours in carefully inspecting two streams which were stocked less than two years ago with Rainbow Trout fry and it is no exaggeration to say that we saw *hundreds* of fry and fish in all stages of growth, from one inch in length to the size of a large minnow.

They were in shoals and in parties of four and five and appeared to be remarkably strong, healthy and wary, taking cover with marvellous rapidity when disturbed. I may state for the information of the sceptical that the streams referred to contain no other fish of any kind or description.

It having now been established beyond any doubt that the Rainbow Trout is breeding in Ceylon, I would suggest that all members of the Ceylon Fishing Club cease forthwith to kill any more of these fish for the space of at least 12 months. Otherwise, we are undoubtedly killing the proverbial goose. Judging from the size of the young fish I saw (from 1¼ inch to 3¼ inch), I should say that they were hatched from ova deposited between October 1st and January 31st.—I am, yours faithfully,

THOS. FARR.

PLANTING NOTES.

RUBBER.—We are indebted to a Colombo merchant for a copy of the elaborate Annual Review of the Rubber Market—covering three pages of foolscap—of Messrs. Kranovisch & Co. of Liverpool and London. We shall reproduce it in full in our *Tropical Agriculturist*, as interesting in itself to all rubber planters and merchants and handy for reference.

LORD LAMINGTON ON QUEENSLAND.—Apart from the interest felt in Queensland as partially a semi-tropical planting country, a paper by Lord Lamington (owing to rumours connected with his name) is bound to meet with due local attention. The paper he read before the Royal Colonial Institute recently is reprinted on page 813.

TEMPLESTOWE ESTATE COMPANY.—The property owned by this Company has been very well worked during the past year, as is testified to in the report which we publish elsewhere. The crop was nearly 18,000 lb. under the estimate, but there was an advance of 1·11 cents in the price obtained and the profit was such as to admit of a dividend of 3 per cent on the ordinary shares, the transference of R5,000 to the depreciation account and the carrying forward of R1,591 30.

PEARL-FISHING EXPERIMENTS.—As oysters differ among themselves, so do pearl-yielding oysters. We suppose that oysters which are valuable for their shells seldom have pearls comparable to those which our local fisheries yield. Now that experiments are being made with the bi-valve which has contributed handsomely, though erratically, in recent times to our exchequer, it may be well if the experiments can be extended to cover oysters within easy reach of the island. We read in an Indian paper that "it is not generally known that pearl-fishing is carried on annually in the Ichamutty river near Bongong. A correspondent states that this year the pearl-fishers have been unusually fortunate. Among the pearls obtained are some exceptionally good ones, which have sold for as much as R400 and R600 each."

RAINBOW TROUT BREEDING IN CEYLON.—All members of the Ceylon Fishing Club, as well as any anglers in the island who have not joined the Club, will read with especial interest Mr Farr's letter elsewhere. It leaves little doubt of the hope which has gradually been growing into a belief that trout have begun to breed in Ceylon. Even now, however, we know there are some who will not credit the signs put forward—unless Mr Farr's letter converts them out of hand. If they can account for the latest facts on opposing theories of their own, we shall be glad to hear from them as the subject is one of the utmost interest, while the introduction of trout ova and the hatchery experiments at Nuwara Eliya still continue in full swing.

CEYLON TEA IN BOSTON.

The Ceylon tea estate proprietor who, having sent some of his own tea to a friend in Boston, received the information in reply that "Ceylon tea was unknown there," once again sends us an extract from a letter he has had by way of rejoinder to the letter of Mr. MacGnane of the Salada Tea Company. The Bostonian resident who, we need scarcely say, has "no axe to grind" and probably never heard of the Ceylon-American Commissioner or Messrs. Larkin & Co., not being in tea, writes to the estate proprietor as follows:—

"Boston, March 19.—I must try and give you some answer to the 'Salada' Tea Manager's letter of December 30th, 1901, which you sent me. It is amusing to see how ruffled he is over my remarks. I still stick to it that Ceylon tea is *not known* in Boston. Mr. McGuane and I happen to be referring to entirely different sets of Bostonians. I referred to the upper classes who reside on the Back Bay and who would never, for a moment expect to lunch or dine at the Crawford-Woodcock, Marston's, Crosby's or Cottrell's restaurants. These are frequented by business men, shop girls and country people. The Lennox Hotel, I did mention in my letter. It is the only first-class hotel Mr. McGnane has mentioned in his letter. The Thorndike is a family hotel—that is, people live there in suites, all the winter, like many others of its kind, but we would not think of going to lunch there. By first-class hotels I mean such as would be starred in '*Baedeker*.' The Touraine is perhaps, the most noted first-class hotel, in Boston I, have myself asked for Ceylon tea there, when lunching with friends, and have been told that they did not serve it. At the clubs too, such as the Somerset, the Union and the University, where ladies whose husbands are members can lunch and dine Ceylon tea is not on the menus. These clubs—especially the first two—are the social clubs of Boston, and membership in either carries with it, admission as guests to the social clubs of London, etc. I think I have said enough so far to convince you that Mr. McGuane and I are talking of entirely diffrent sets of Bostonians. He apparently does not know my set, and I certainly do not know his. So with regard to the tea room. The locality he suggests would be patronised by people who would dine at Crosby's or Martin's. The locality I suggested would be patronised in the afternoon by Back Bay people. Society people do not shop down town (Washington Temple and Winter Streets) in the afternoon. The shopping is all done in the morning—after which lunch is had either at home, or at one of the clubs, or the Touraine. What is wanted in Boston, from *my* standpoint, is a nice tea room where ladies and gentlemen could go after a concert, or a visit to the picture galleries, or a walk or a drive. Tea at Marston's and such like places is served in *thick* semi-porcelain cups, such as one would see in Glasgow at 'Lockhart's' dining rooms—not in dainty china cups with nice spoons and knives. At a recent 'fair' I sold Ceylon tea (*not* the 'Salada brand, whatever that may be) and I have had dozens of enquiries since from my own personal friends as to where they could get more! One lady to whom I gave some of the tea you sent me—two years ago—asked me the other day if I would tell her what tea it was, as she could not get it and had even sent to New York for tea at $5 (20/) a pound, hoping it might be as good. But I have said enough. My letter to you was written entirely in the interests of Ceylon tea. I still stick to it that the article 'Ceylon Tea' is not known well in Boston—whatever the special brand called 'Salada' may be. A thousand or more such signs as 'Salada' does *not* advertise CEYLON TEA pure and simple—but a special brand of a special company. It is like advertising Lipton's tea—which may be a blend of every tea in the world and not necessarily *Pure Ceylon Tea.* I hope this will explain matters.

To turn to another subject, Prince Henry's visit was quite amusing. Boston looked lovely in a fresh mantle of snow with clear bright skies overhead. He passed our house, driving at a tremendous pace and accompanied by the most awfully mounted cavalry I have ever seen. I suppose it *was* hard riding in the snow at such a pace, but the men kept falling off their horses and rode like potato sacks. It was a humiliating exhibition, and the Prince remarked to Admiral Bob Evans, who was with him, that men who rode like that in Germany were arrested! I was very fortunate in getting a ticket of admission to Sanders' Theatre in Cambridge, where Prince Henry had his LL.D. degree given him. I was right in the middle of the third front row, so I saw him very well. He is a very handsome man, over six feet in height, and absolutely thorough-bred looking."

In regard to the "tea" reply, our friend ("Estate Proprietor") writes:—

"I'm bound to say it is a high-flying defence: has an atmosphere which is death to anything but 'blue blood' and is redolent of the "hub of the universe"! Personally it is the horny-handed toiler, that I would like to see attracted to Ceylon tea, who would take to it and come again, albeit to have it the vogue in Society circles would mean a good deal too, for its being in the fashion would in time filter from the classes to the masses who quickly follow suit.—especially in America, where one man is as good as another."

We think the "Thirty Committee" will admit there is enough useful information in the above correspondence to justify its publication. Evidently there are attractions in "pure Ceylon Tea" which ought to make it a profitable article of sale among the better classes in Boston and why not of other New England towns, not to speak of New York, Philadelphia and Chicago. Meantime, enterprising Mr. Wm. Saunders and his supporters might do worse than arrange for a "Tea-room" to sell and serve pure Ceylon Tea in the West end of Boston, U. S. A.

THE PARASITIC ORIGIN OF PEARLS.

We have already mentioned the observations of Dubois and other French investigators on the parasitic origin of pearls. At a recent meeting of the Zoological Society of London, Dr H L Jameson said the pearls of the mussel were caused by the larva of a parasite allied to the liver-fluke. The larva is encysted in the mantle of the mussel, and if it dies is calcified, thus forming the core of a pearl. There is hope of producing pearls artificially by their means.—*Globe*, April 11.

TEA CROPS AND PROSPECTS IN INDIA AND CEYLON: IS THE MAXIMUM OUTTURN OF TEA CLOSE AT HAND? CONSENSUS OF OPINION AS TO "A GOOD TIME COMING."

We are surprised that in their interesting review of the Indian Tea Market for 1901-2 (which we reproduce elsewhere), Messrs. Carritt & Co. do not dwell more clearly on the risk arising from an unusually large crop during season 1902-3, owing first to the extensive area planted in 1898 now coming into bearing and, secondly, to the unlikelihood of a second unfavourable season in regard to weather. Leading Calcutta-merchants in December last made special mention to us of the above risk, adding that, if 1902 were once rounded off without any serious blow to tea, they had the utmost confidence in the future of the industry. There have been no plantings of any serious consequence since 1898 and probably in India, as in Ceylon, the very maximum of crop outturn is close at hand. As regards young tea coming into full bearing, Messrs. Carritt & Co. seem, indeed, to think the period is passed; but they must have overlooked the figures of 1898 and their relation to the present season. They say:—"the "coming season can be viewed with con- "fidence so long as the outturn continues "on a moderate scale," and they are inclined to think that "scarcity of labour" may counterbalance any climatic advantage. We shall see. But we trust in any case that careful "plucking" will distinguish the majority of Indian gardens, so as to prevent a disastrously large export to the London market during 1902 3.

Turning to Ceylon, it is becoming increasingly evident that our export of black tea to London will be moderate this year. Still more, the opinion is gaining ground that we have probably seen our maximum total export of tea in the 148 million lb. sent away in 1900. The limit of "ten years" given by Mr. Robert Porter for average tea gardens in Ceylon—including the many formed out of old coffee plantations—beyond which their crop outturn cannot be maintained without the application of manure, is, we find, generally accepted; and what with the abandonment of unprofitable fields here and there, the general cessation of planting beyond small clearings few and far between,—we cannot see how Ceylon can send away more than between 140 and 150 millions of lb. of tea during each of the next two or three years. Considering, therefore, the natural expansion of consumption in the larger consuming countries, the good prospect of gaining ground for British grown teas on the Continent of Europe, especially in Russia; the favourable future before "green teas,' particularly in America; the likelihood of the Imperial war-tax being taken off tea in 1903, or at latest in 1904; and, though last, not least, the prospect of the spread of a taste for tea among many millions who can afford to drink it, in India,—we certainly agree that there must be "a good time coming" for planters both here and in the Indian districts, who are favoured with fertile gardens, or who can keep their gardens in good heart by judicious cultivation, including the application of suitable fertilisers.

To back our opinion we may quote the following sentences from the letter of an authority who has a wide practical knowledge of what tea is doing both in Ceylon and India. He writes, after a tour of inspection through certain local districts:—"Properties generally seem to be flushing well; but this is the season for flush, and exports are still 4½ million lb. behind those of last year; and yet Ceylon was plucking fine last year during this period." As regards the outlook generally the same writer says:—"My opinion about tea in general is that it is bound to turn the corner before long (though it may take longer than was expected) and that, if cultivation of estates is maintained—so that the bushes do not go back, and yields consequently decrease,—tea properties will yet pay as well as ever they did in the past, even in the low-country and at medium elevations."—So mote it be!

CEYLON TEA IN CANADA.

GREEN TEAS NOT PERFECT: PINE-WOOD TEA-CHESTS INJURIOUS.

We have had placed at our disposal, and have much pleasure in publishing, the following extract of a letter received by a leading Colombo firm from a large tea importer in Montreal, which will interest a large section of our readers, while it scarcely needs any special comment at our hands. The letter speaks for itself and with no uncertain voice:—

"In reply to your enquiry *re* the prospect of Ceylon and Indian teas with the Canadian market, I may tell you my own opinion, which is, that they have a good prospect in blacks as much as Japan has in its green. They try quite hard to compete with us in green tea recently, but unless they *make still further improvements*, I do not think they can ever displace us from the market. There are many defects on their part if I point out, but it is needless to tell you about its make, etc., except something wherewith you are interested directly.—It may be interesting to you to know that I have seen many packages of Ceylon tea which are not of Momi wood, but of Pine; the latter, in my opinion, is not from Japan and resembles very much Chinese Pine. As you have some idea of tea, you should know that boxes for tea made out of Pine-wood, either from Japan or elsewhere, cannot be good for tea, and I am greatly surprised to see the Ceylon merchants (who are so earnest in pushing their tea and affecting all kinds of improvements) use boxes made of Pine. Perhaps China Pine is cheaper, but cheap things always come out dearer in the end."

We may add that the writer is the Representative of the Japan Central Tea Traders' Association, and the above is interesting as giving an idea of the view taken by our competitors as to the success of our competition with them in the Canadian market.

BANDARAPOLA CEYLON COMPANY, LIMITED.

REPORT OF THE DIRECTORS

To be presented to the Shareholders at their 9th annual ordinary meeting to be held at the office of the Company, 16, Philpot Lane, London, E.C., on Wednesday, 7th May, 1902, at 12 noon.

The Directors have pleasure in submitting to the Shareholders the Accounts and Balance Sheet for the year ending 31st December, 1901, with Auditor's certificate attached.

After payment of Debenture Interest and all other charges, the net profits for the year amount to £2,223 19s 9d, which with £407 18s 4d, brought forward from previous accounts, gives a total to be dealt with of—£2,631 18s 1d. It is proposed to pay a Dividend for the year, of 6 per cent. (free of Income Tax) absorbing £1,260. To write off Estates Account £500. To write off for depreciation on Buildings and Machinery 10 per cent on £5,265 11s 2d.—£526 11s 2d. £2,286 11s 2d. Leaving a balance to carry forward of £345 6s 11d.

The crops secured during the season amounted to 468,901 lb Tea (including 18,892 lb from purchased leaf) and 303 cwts. 0 qrs. 18 lb Cocoa, against 487,432 lb. Tea, and 267 cwts. 1 qr. 13 lb Cocoa during the previous year.

The average yield per acre was 575 lb of Tea, against 612 lb per acre during 1900, this shortage being chiefly due to finer plucking, while the prices realized were 33 cents per lb for the Teas sold in the Colombo market, and 6·254d in London against 5 512d last year.

The average rate of exchange was 1/1 3/8ths per rupee.

The acreage of the Company's holdings has not been altered during the year, and remains as stated in last Report, viz :—

Tea in bearing	..	.. 782 acres
Tea not in bearing	..	... 6 ,,
Cocoa in bearing	..	.. 224 ,,
Grass, Ravines, &c.	...	.. 12 ,,
Reserve, Jungle, &c.	..	.. 525 ,,
Total acreage ...		1,549 acres

The Visiting Agent, Mr Joseph Fraser, reports that the general appearance of the estate is most satisfactory, showing a remarkable absence of insect and fungoid pests, and the Board take this opportunity of expressing their appreciation of the services of their Manager, Mr James Anderson.

Of the Debenture Issue £2,100 matured for payment on 1st January, 1902, of which £1,850 was renewed for three years, and £250 for five years at 5 per cent interest per annum.

In accordance with the Articles of Association Sir George A Pilkington retires from the Board, and, being eligible, offers himself for re-election.

Mr John Dalgleish, C.A., also offers himself for re-election as Auditor. G W PAINE, Chairman.

16, Philpot Lane, London, E.C., 22nd April, 1902

GALAHA CEYLON TEA ESTATES AND AGENCY COMPANY, LIMITED.

REPORT OF THE DIRECTORS

to be submitted to the shareholders at the fifth annual ordinary general meeting to be held at 30, Mincing Lane, E.C., on Thursday, 8th May :—

The Directors have pleasure in submitting their report, also statements of accounts duly audited for the period of 12 months ending 31st December last. The gross profit for the season after providing £400 for depreciation on machinery, &c., is £10,357 8s 2d; add balance of last account £100 14s 8d; equal £10,468 2s 10d; from this has to be deducted interest on £55,000, debentures at five per cent per annum £3,750 dividend on £60,000, preference shares at 6 per cent per annum £3,600; London charges—fees to Trustees, Directors and Auditors £550, interest on loan £660 8s. 5d., income tax, Insurance, &c., £248 1s 7d leaving a balance of £2,659 12s 10d, which the Directors appropriate as follows :—transfer to reserve £1,000 dividend proposed, three per cent on £50,000 ordinary shares, £1,500, balance to carry forward, £159 12s 10d; equal to £2,659 12s 10d.

The tea crop during the season, including 48,053 lb from bought leaf, amounted to 1,217,329 lb, and the cardamom crop was 16,973 lb.

Notwithstanding that the crop was considerably below the estimate, owing to the unfavourable weather which prevailed all over the Island of Ceylon last year, and to the finer plucking adopted on the estates, the net profits would have permitted of a dividend of six per cent. being paid on the ordinary shares for the year, but the Directors, following out their policy have written off £400 for depreciation on machinery, transferred £1,000 to the reserve, bringing that Fund up to £6,700, and recommend a dividend of three per cent, on the ordinary shares for the year.

The Directors are glad to say that the standard of quality of the Company's teas has been fully kept up and they meet with continued favour.

The factory machinery and all buildings are being well maintained and the estates are in the highest state of cultivation.

On the 31st December last the Company had under cultivation in tea 2,867 acres, and in cardamoms 235 acres and the following is a schedule of the acreages of the Company's estates :—

	Tea: 3 years and over.	Tea: Under 3 years.	Cardamoms.	Timber.	Patna, etc.	Total.
Dunally and North Vedehette ...	404	—	49	—	269	722
Galaha ..	618	—	61	42	58	779
Goorookelle ..	872	—	—	—	563	1435
Kitoolmoola ..	342	—	46	17	25	420
Mausakelle ..	258	5	—	—	397	660
Vedehettes, East and West ..	368	—	79	69	324	840
	2862	5	235	128	1636	4866

Mr C E Strachan now retires from the Board, and, being eligible, offers himself for re-election.

The appointment of Auditors rests with the shareholders, and Messrs. Fuller, Wise, and Fisher offer themselves for re-election.

BURNSIDE TEA COMPANY OF CEYLON' LIMITED.

REPORT OF THE DIRECTORS

To be presented to the Shareholders at their sixth annual ordinary meeting to be held at the office of the Company 16, Philpot Lane. London, E.C., on Wednesday, 7th May 1902, at 2 30 p.m.

The Directors beg to submit to the Shareholders the Report and accounts of the Company, duly audited, for the year ending 31st December, 1901.

The total crop from the four estates was 353,284 lb. Tea against 402,113 lb for last year and 9 maunds of Tea Seed were obtained and sold as compared with 52½ maunds in 1900.

For the deficiency in crop of 48,829 lbs., Wattagalla Estate is mainly responsible, and the present Manager considers that the shortage is fully accounted for by the fact that a large area fell due for pruning in the middle of the year, in addition to which somewhat finer plucking was resorted to over all the estates.

Mr. Thomas Smith, our Visiting Agent, in his report of his visits towards the end of January to Burnside, Heeloya and Wattagalla states that through all the old fields of Tea there is no falling-off in the appearance or condition of the bushes, and that

he considers the Tea shews as good growth, as healthy appearance, and is just as capable of giving good crops as it ever was, and both Mr. Smith and Mr. Porter report favourably of the condition of the Estate and prospects of crop at Midlothian.

The average price obtained in London for the Burnside Group was 6·047d per lb., and in Ceylon 32½ cents, while the corresponding averages for Midlothian were 7·108d per lb., and 37½ cents respectively. The average rate of Exchange was 1/4 25/64ths per rupee.

The shortfall in crops and the extremely poor price obtained during the first six months of the year account for the unfortunate position shewn by the attached Balance Sheet, and the Directors regret that to the loss carried forward from last year a further deficit of £742 10s 6d has to be added, making the amount at debit of Profit and Loss Account £1,067 5s and 10d.

The Directors have to report that the Debentures which matured on the 1st January last have been renewed as follows, bearing interest at six per cent per annum:—

For three years	...	£5,250
For five years	...	9,150
		£14,400

The latest Reports from all the Company's Estates speak favourably of their condition and of the crop prospects, the total amount of tea made up to the end of March shewing a considerable increase on last year's figures.

In accordance with the Articles of the Association Mr G W Paine retires from the Board, and being eligible, offers himself for re-election.

Messrs Cape & Dalgleish, C A., also offer themselves for re-election as Auditors. By order of the Board, LYALL, ANDERSON & Co., Agents and Secretaries.

16, Philpot Lane, London, E C, 23rd April 1902.

EDERAPOLLA TEA CO. OF CEYLON LTD.

REPORT OF THE DIRECTORS.

To be presented to the Shareholders at their sixth ordinary general meeting, to be held at the Office of the Company, 16, Philpot Lane, London, E.C., on Monday, 5th May. 1902, at 12 noon.

The Directors beg to submit to the Shareholders the Report and Accounts of the Company, duly audited, for the year ending 31st December, 1901.

Inclusive of 22,017 lb. made from bought leaf, the total out-turn of Tea from the three Factories amounted to 508,058 lb., showing a decrease of 46,372 lb. compared with last season; a deficiency chiefly due to more careful plucking throughout the year.

The average price realised was 6·186d per lb. as against 5·803d per lb. last year, and the average rate of Exchange was 1/4 3/8ths, compared with 1/4 27/64ths for 1901.

The net profit for the year amounts to £1,336 9s 7d, which, with £421 15s 1d brought forward from last year, gives £1,758 4s 8d to be now dealt with, and this it is proposed to apportion as follows:—

Amount as above		£1,758 4 8
To Dividend of 5 per cent. (free of Income Tax) ...	£1,275 0 0	
To write off Estate Account..	300 0 0	
		1,575 0 0
To carry forward to next Account ...		£183 4 8

It is hoped that Mr Porter, who has been in Ceylon for the past three months, will have returned in time to be present at the General Meeting now called, so that the Shareholders can obtain from him the latest information as to the condition and prospects of the Company's Properties, the detailed acreage of which, as on 1st January last, is now given:—

	Tea in full bearing.	Tea in partial bearing.	Paddy Field.	Jungle.	Patna and Scrub.	Cardamoms not in bearing.	Total.
Ardross ..	258	15		42½	8½		324
Ederapolla..	381	148	7	68	44		648
St Helens ..	255				34½	13½	303
Totals..	894	163	7	110½	87	13½	1,275

In accordance with the Articles of Association, Mr J M Macmartin retires from the Board at this time, and being eligible, offers himself for re-election.

Messrs. Cape and Dalgleish, C.A., also offer themselves for re-election as Auditors.

G. W. PAINE, Chairman.

16, Philpot Lane, London, E.C., 21st April, 1902.

HIGHLAND TEA COMPANY OF CEYLON.

REPORT OF THE DIRECTORS,

To be presented to the Shareholders at their sixth annual ordinary meeting, to be held at the Office of the Company, 16, Philpot Lane, London, E.C., on Tuesday, 6th May, 1902, at 10-30 a.m.

The Directors have pleasure in submitting to the Shareholders the Balance-sheet and Accounts for the year to 31st December, 1901, with Auditors' Certificate attached.

The net profits for the year amount to £1,499 3s 6d. to which has to be added £105 10s 3d. brought forward from previous accounts, giving a total to be dealt with of £1,604 13s 9d., and this amount it is proposed to apportion as follows:—

Amount as above £1,604 13 9; An Interim Dividend of 2 per cent. (free of Income Tax) paid in September, absorb £640 0 0; It is now proposed to pay a final dividend at the same rate, making 4 per cent. for the year (free of Income Tax) £640 0 0; To write off Estates Account £250 0 0. Total £1,530 0 0. Leaving a balance to carry forward £74 13 9.

The results for last year are disappointing, showing, as they do, a considerable shrinkage from the profits of previous seasons. The factors which have brought about the shortage in question are twofold, viz., the depressed state of tea market, especially during the early part of the year, and the shortness of crop owing to the unfavourable climatic conditions in Ceylon.

The total crops secured for the year from Chrystlers Farm and Glenorchy estate amounted to 241,481 lb. against 262,510 lb., the average yield over all being 413 lb. made tea per acre against 448 lb., in the previous season, while the average price realized in London was 7¼d., against 8d. per lb.

During the later months of the year your Directors have been selling the Tea from Glenorchy estate in the Colombo market, the average price realized there being 45 cents per lb., which compares favourably with the prices previously obtained in London.

The average rate of exchange was 1/4 11/64ths as compared with 1/4 19/64ths at which the previous accounts were made up.

Mr. R Porter, now on his way from Ceylon, paid visits recently to both estates and reports that he found them in excellent order.

In accordance with the Articles of Association, Mr. George G Anderson retires from the Board, and, being eligible, offers himself for re-election.

Messrs. Cape & Dalgleish, C.A., also offer themselves for re-election as Auditors.

By order of the Board, LYALL, ANDERSON & Co., Agents and Secretaries.

16, Philpot Lane, London, E.C., 22nd April, 1902

KELANI VALLEY TEA ASSOCIATION, LIMITED.

REPORT OF THE DIRECTORS

To be presented to the shareholders at their sixteenth ordinary general meeting to be held at the Office of the Company, on Monday, 5th May, 1902, at 2 p.m.

The Directors beg to submit to the shareholders the report and accounts of the Company, duly audited, for the year ending 31st December, 1901.

The crops from the Company's four estates amounted to 549,906 lb. against 662,248 lb. in 1900; the average price realised was 6 206d against 5·7941, and the average rate of exchange 1s 4⅜d as compared with 1s 4 27-64 in the previous year.

The shortfall in the crop compared with 1900 is partly due to more careful plucking which was adopted at the beginning of the year, but it is also traceable, to a large extent, to the adverse climatic conditions that prevailed during the latter part of the year.

Although the prices obtained in the later months were fairly satisfactory, the average price for 1901 is very little above that for 1900, as the rates that ruled during the first six months were very low.

The net profit for the year amounts to £612 12s 5d, which, with £456 15s brought forward from 1900, makes £1,069 7s 5d now available. Out of this sum the Directors propose to write 5 per cent off on buildings and machinery, which will absorb £638 2s 11d, leaving £431 4s 6d to be carried forward to next season's account.

Debentures to the extent of £7,400 matured during the year, and have been renewed for three or five years at 5 per cent per annum.

Owing to continued absence from London, Mr L F Davies found it impossible to attend the Board Meetings, and he therefore tendered his resignation, which was accepted with much regret.

In accordance with the Articles of Association, the Board have elected Mr John Wallace Stocks, who is duly qualified, to fill the vacancy thus created.

In accordance with the Articles of Association, Mr G W Paine retires from the Board, and, being eligible, offers himself for re-election.

Mr J B Laurie, C. A., also offers himself for re-election as Auditor.

C. W. Paine, Chairman.

16, Philpot Lane, London, E.C., 21st April, 1902.

POONAGALLA VALLEY CEYLON CO., LTD.

REPORT OF THE BOARD OF DIRECTORS

To be presented to the shareholders at their sixth annual ordinary meeting, to be held at the Office of the Company, 16, Philpot Lane, London, E.C., on Tuesday, the 6th May, 1902, at 2 p.m.

The Directors beg to submit the report and Accounts of the Company, duly audited, for the year ending 31st December, 1901.

The total crop of tea amounted to 396,593 lb. shewing a decrease compared with that of last season of 84,293 lb. the result, to a certain extent, of finer plucking, but chiefly caused by the severe drought experienced in June, July, and August, and to very high cold winds during the latter months of the year.

This serious shortfall, coupled with the very poor prices realized during the first six months of the past year, is accountable for the unfortunate result of the year's working, the loss shewn having been incurred during the half-year ending 30th June. The estates are in good heart and condition, and, given seasonable weather and a fair market, it is hoped that the year now entered upon will end much more satisfactorily.

The Balance Sheet herewith shews that the loss on the year's working amounts to £1,233 19s 11d; and, deducting therefrom £216 2s 8d brought forward from last year, the debit of Profit and Loss Account stands at £1,017 17s 3d.

The following figures are given for comparison:—

	1901.	1900.
Total Tea Crop secured	396,593 lb	480,886 lb
Total Coffee Crop secured	147½ bushels	231 bushels
Average Price realised for Tea—		
Sold in London	7d per lb	5 44d per lb
Sold in Ceylon	36 cents	—
Total Rainfall	69·64 inches	1080·7 inches
Average rate of Exchange	1/4⅜ths	1/4 13-32nds

On the 30th September, at 3 a.m., during the prevalence of a very heavy south-westerly gate, the new Withering House at Poonagalla took fire, and, but for the presence of mind and hard work on the part of the Tea-maker, watchman, and coolies, before the Manager could arrive, the main Factory building would have been destroyed.

The building and contents were fully insured, and the Company will suffer but little pecuniary loss.

The re-erection of the Withering House was immediately taken in hand and is now almost complete.

During the year 25 acres in the Jungle strip at Lunugalla have been planted with cardamoms, which promise well, and the Visiting Agent recommends a further 20 acres being so treated during the present season.

Your Directors have to announce that, in order to provide further necessary capital, the Chairman has had to advance £7,000 on second debenture bonds for four years, bearing interest at 6 per cent per annum.

In accordance with the articles of Association, Mr Robert Porter retires from the Board, and, being eligible, offers himself for re-election.

Messrs. Cape and Dalgleish, C.A., also offer themselves for re-election as Auditors.—By Order of the Board,

Lyall, Anderson & Co.,
Agents and Secretaries.

16, Philpot Lane, London, E.C. 21st April, 1902.

THE SUNNYGAMA (CEYLON) TEA ESTATES COMPANY, LIMITED.

THE REPORT OF THE DIRECTORS

to be submitted to the shareholders at the general meeting to be held on Wednesday, 30th April, 1902, at 11 a.m. at No. 34, Great St. Helen's, London, E C.,

The Directors herewith submit their Ninth Annual Report, together with statement of accounts and balance sheet for the year ending 31st Dec., 1901.

The profit and loss account (including £107 9s 6d carried forward from last year) shows a credit balance of £1,928 0s 9d, after paying interest on the debentures to 1st January, 1902, which the Directors propose to apply as follows:—To pay a balance dividend of 3 per cent on the preference shares for the year ended 31st December, 1900, £450; to pay a dividend of 6 per cent on the preference shares for the whole year 1901, £900; total £1,350; carrying forward the balance, viz, £578 0s 9d, total £1,928 0s 9d.

The following figures show the result of the year's working:—

Sunnycroft Estate.—Crop—641,673 lb tea at an average net price of about 5 9-16d realised £14,871 4s 8d, interest on account £76 16s 3d, total £14,948 0s 11d. Expenditure—Cost of cultivation, shipping, etc., £11,301 15s 8d, profit £3,646 5s 3d.

Pambagama Estate.—Crop—276,861 lb tea at an average net price about 4 15-16d realised £5,713 9s 8d, 9,615 lb tea sold in Ceylon, realizing R1,642 at Exchange of 1/4, £109 9s 4d, total £5,822 19s 0d, Expenditure—Cost of cultivation, shipping, etc., £6,195 16s 8d, interest on account, £8 9s 8d, total £6,204 6s 4d, loss £381 7s 4d, net profit £3,264 17s 11d.

The total crops amounted to 928,149 lb, against an estimate of 1,080,000 lb given in the last Report, the reduction being caused by the finer plucking then referred to. This, together with the better market has led to improved prices, the gross average price of

Sunnycroft being about 6½d per lb against 6d last year, and Pambagama about 5⅜d against 4⅜d. The latter estate costs more to work than the former, and the tea is not quite so good, but the quality is improving, and it is hoped Pambagama will show a better result in the next annual report.

Estimates for the current year provide for crops and expenditure (Ceylon) as follows:—

	Crop. lb	Expenditure. R.	Cost per lb. F.O.B.
Sunnycroft ..	780,000	180,834	23 cents.
Pambagama ..	335,000	83,800	25 „
	1,115,000	264,634	23·73 cents.

On the above basis the cost laid down in London at the current rate of Exchange will be about 4⅜d. per lb.

In addition provision has to be made to the extent of R1,500 on each estate, for planting shade rubber trees, and, in the case of Pambagama, R500 for improving the coolie lines, which may be regarded as capital expenditure.

The amount spent on buildings and machinery, &c., has been £2,767 2s. 4d., which has been met without having recourse to an issue of debentures referred to in the last report.

Both estates are now provided with adequate buildings and machinery, and are reported upon as in good order and condition. No further extensions are contemplated at present. The total area is as follows:—

	Planted.	Reserve.	Total.
Sunnycroft ..	1,145	668	1,813 acres
Pambagama ..	607	371	978 „

Mr J B Keith, one of your Directors, retires by rotation, and does not seek re-election. Mr W R Arbuthnot, jnr., will be proposed to take his place on the Board.

Messrs. Durry, Thurgood & Co, the Auditors of the Company, also retire, and again offer their services.

THE KANDAPOLLA TEA COMPANY, LIMITED.

REPORT OF THE DIRECTORS

to be submitted at the general meeting to be held on Wednesday, the 30th April, 1902, at noon, at the offices of the Company.

The Directors submit the statement of accounts to 31st December, 1901.

The Profit and Loss Account shows a profit on the working of the estates of £2,644 14s 4d ; interest, £14 10s 6d ; doubtful coast advances recovered, £5 13s 0d ; transfer fees £0 10s 0d; brought forward from last year, £586 13s 7d.=£3,252 1s 5d.

The Directors have paid the interest on the debentures, viz., £1,570 ; dividend on the preference shares to the 30th June, 1900, £939 ; home charges, as per account, £147 1s 9d ; leaving a balance to be disposed of of £595 19s 8d.=£3,252 1s 5d.

The Directors propose to place to the depreciation of machinery account, £250 ; carrying forward the balance, £345 19s 8d,=£595 19s 8d.

The estimates for the year were based upon a yield of 497,000 lbs. The crop resulted in a total of 411,682 lbs., a falling-off of 85,318 lbs., and, as compared with the preceding year, the decrease is 72,697 lbs.

During the year some 150 acres have been manured, chiefly with non-stimulating chemical manures. The cost of this is included in the current expenditure.

The cost of production averages 37·10 cents per lb of made tea. The amount realised by sale works out at 46 25 cents gross, the profit being 9·15 cents per lb., as compared with 13 20 in 1900, and 14·20 in 1899.

The estimates for the current year are based upon a normal yield, and on a system of medium to fine plucking.

The labour supply and coast advances are in a sound position on all the properties.

The buildings and machinery are generally in good order and repair, but as the engine on Kandapolla, which has now been running for many years without a stop, is showing signs of wearing out, your Directors have approved the erection of two oil engines of 9-h.p. each, which are now in working order. A considerable saving in the cost of fuel will probably result from this, firewood being a very expensive item at the present time. Should the yield on Devonford increase during the year, as anticipated, it will be necessary to erect a new roller.

£250 has been set aside this year towards the provision of this new machinery.

The yield for the year was lower than was expected, especially during the months of November and December, owing to unfavourable weather, whilst the market price for fine and medium teas, such as are produced upon the Company's properties, was lower than in any previous year.

The following is the total acreage of tea, &c., and crop secured for 1901 :—

Estates.		Tea Acreage. Acres.	Forest, Waste, &c. Acres.	Tea Crop lb.
Kandapolla (Group)	...	369	17	159,206
Frotoft (Group)	..	478	177	121,211
Erroll	...	215	24	68,971
Devonford	..	245	42	62,294
		1,307	260	411,682

Mr J H Alexander, the Director, who retires by rotation, does not offer himself for re-election in consequence of frequent absences from London.

The appointment of Auditors rests with the shareholders.

THE DIMBULA VALLEY (CEYLON) TEA CO,. LIMITED.

DIRECTORS' REPORT

To be submitted to the Shareholders at the sixth annual ordinary General Meeting, to be held at the Cannon Street Hotel, on Thursday, 24th April, 1902, at 12 o'clock noon.

The Directors beg to submit the General Balance Sheet and Profit and Loss Account for the twelve months ending 31st December last.

After bringing forward £1,973 10s 6d from last account, and providing for general expenses, London Office expenses, Superintendents' commissions, and £500 for depreciation, the nett amount at credit of Profit and Loss Account for the year ending 31st December last is £15,474 3s 8d.

Dividends aggregating 6 per cent., less Income Tax, have been paid for the 12 months ending 31st March on the Preference Shares, amounting to ..	£ 3,440 2 6
An Interim dividend of 4 per cent., less Income Tax, on the Ordinary Shares has been paid, and amounted to ..	4,586 12 0
It is proposed to pay a final dividend of 4 per cent. on the Ordinary Shares, making 8 per cent. for the year, and which will amount to ..	4,586 12 0
It is proposed to carry to Reserve Fund a sum of .. .. (Making the total at Reserve £5,000).	2,000 0 0
Leaving to be carried forward ..	860 17 8
	£15,474 3 8

The crop amounted to 1,193,357 lb. to 31st December, against for the previous twelve months 1,091,963 lb.

The Directors recommend a final dividend of 4 per cent. on the Ordinary Shares, making 8 per cent. for the year.

The cost of cultivation and placing the crop on board ship was 26·18 cents, against 26·97 cents the previous nine months.

The total crop, including 46 cwt. coffee, realised £36,262 19s 11d nett, equivalent to a gross average for the tea, of 8·11d per lb., against 8·98d last year and 9·40d for the previous season.

Mr Keith F Arbuthnot has been re-appointed to the Board of Directors.

Mr W Forbes Laurie retires by rotation, but being eligible, offers himself for re-election.

Messrs. Singleton, Fabian & Co, the Auditors to the Company, retire, and, being eligible, offer themselves for re-election.

JAMES SINCLAIR, Managing Director; ROWE, WHITE & Co., Secretaries.

April 14th, 1902.

THE ALLIANCE TEA COMPANY OF CEYLON, LTD.

REPORT OF THE DIRECTORS

to be submitted at the annual ordinary general meeting of shareholders, to be held at the Company's Office, 9, Fenchurch Avenue, London, E.C., on Friday, 9th May, 1902, at 11·30 a.m.

The Directors have pleasure in submitting the balance sheet and profit and loss account for the year ending 31st December, 1901.

The Nett Profit, after payment of Debenture and other Interest for the year, amounts to ..	£4,868 16 10
To which has to be added the Balance brought forward from 1900	1,272 10 1
	£6,141 6 11

An Interim Dividend of 3 per cent was paid on the 26th September, 1901, absorbing £1,957 16s; and the Directors now propose to deal with the balance as follows:—(1) In writing off from cost of properties as depreciation of machinery, &c. £1,000; (2) In payment of a final dividend (free of Income Tax) of 3 per cent (making 6 per cent for the year) £1,957 16s; (3) In carrying forward to next year the balance of £1,225 14s 11d. Total £6,141 6s 11d.

The following table gives the acreages and results for the year:

Estate.	Acreage in full and partial bearing.	Tea Crop, lb.	Yield per acre.	Cost of Crop per lb in cent.	Net price realised per lb. in price.	Working Profit.		
Aberdeen	361	101,537	281	29·85	4·79	12	2	0
Calsay	365	172,604	473	30·30	6·79	1,355	7	3
Dunkeld	517	184,883	358	31·14	5·92	685	14	2
Luccombe	542	173,751	321	29·80	5·42	470	0	3
Thornfield and Gleneagles	457	257,604	564	26·47	7·25	3,185	8	3
Uda Radella	413	196,482	476	28·88	8·20	2,883	12	2
	2,655	1,086,861	409	29·16	6·60	£8,592	4	1

The results from Thornfield, Gleneagles and Uda Radella are very satisfactory, but the Working Profits of Aberdeen and Dunkeld estates show a considerable decline owing to the reduced tea crops.

The total acreage of the estates on 1st January, 1902, was as follows:—

Estates.	Acreage under Tea. In full bearing.	In partial bearing.	Not in bearing.	Total.	Forest Reserves, &c.	Total Acreage.
Aberdeen	347	14	—	361	119	480
Calsay	352	13	10	375	12	387
Dunkeld	517	—	—	517	79	596
Luccombe	542	—	—	542	208	750
Thornfield and Gleneagles	457	—	7	464	48	512
Uda Radella	405	8	62	475	80	555
Kehelgama	—	—	—	—	322	322
	2,620	35	79	2,734	868	3.602

In accordance with the Articles of the Association, Mr. R. S. Corbett retires from the Board at this meeting, and, being eligible, offers himself for re-election.

Messrs. W B Peat & Co. also offer themselves for re-appointment as Auditors to the Company.—By order of the Board,

W. H. BARTLETT, Secretary

London, 28th April, 1902.

THE RAGALLA TEA ESTATES LTD.

REPORT OF THE DIRECTORS

to be submitted to the shareholders at the seventh annual ordinary general meeting, to be held at 30, Mincing Lane, E.C., on Monday, 5th May, 1902, at 12 o'clock noon.

The directors beg to submit their report and also statement of accounts duly audited, for the period of twelve months ending 31st December last—

Showing a net profit for that period, after writing off £200 for depreciation of		£3,828 19 4
Add the balance of last account ..		152 8 4
		£3,981 7 8
Out of which the following dividends have been paid:—		
1901, 1st July—Preference Shares ..	£1,050 0 0	
1902, 1st Jan. do.	1,050 0 0	
		2,100 0 0
		1,881 7 8
From which the Directors recommend a dividend of 4½ per cent on the ordinary shares, free of income tax ..		1,755 0 0
Leaving a balance to carry forward of ..		£126 7 8

The tea crop for the season amounted to 648,442 lb., against the estimate of 750,000 lb., and the shortage of 102,000 lb. was owing to the unfavourable weather that prevailed during the greater part of the year, and also to the finer plucking adopted on the estates. The net average price of the tea was 6·97d. per lb.

The crop for the present season is estimated at 745,000 lb., which should be fully realised.

The Directors are pleased to say that progress is being made with the Railway to the Udapussellawa district. The Government have acquired from the Company the necessary lands for the terminal station, and it is expected the line will be open for traffic some time next year.

The following are the acreages of the Company's estates:—

Name.	Tea.	Coffee.	Timber	Patna, &c.	Total.
Ragalla and Halgran Oya	911	—	177	302	1390
Kelburne	730	10	177	64	981
	1641	10	354	366	2371

Under Clause 97 of the Articles of Association Mr. C E Strachan retires from the Board, and being eligible offers himself for re-election.

The appointment of Auditors rests with the Shareholders, and Messrs. Fuller, Wise and Fisher offer themselves for re-election.

C. E. STRACHAN, M. P. EVANS, *Directors.*
M. P. EVANS & Co., *Secretaries.*

London, April 28th 1902.

SCOTTISH CEYLON TEA CO, LTD.

REPORT OF THE BOARD OF DIRECTORS.

To be presented to the Shareholders at their thirteenth annual ordinary meeting, to he held at tho Office of the Company, 16 Philpot Lane, London, E.C., on Monday, 12th May, 1902, at 12 o'clock noon.

The Directors have pleasure in submitting to the Shareholders the Accounts and Balance Sheet for the year ending 31st December, 1901, with Auditor's Certificate attached The net profits for the year amount to £4,154 5s 11d, to which has to he added £413 13s 5d brought forward from last Acconnts, giving a total to be dealt with of £4,567 19s 4d, and this it is proposed to apportion as follows:—Amount as above £4,567 19s 4d; To interim Dividend on the Ordinary Shares of 3½ per cent (free of Income Tax) paid in September, 1901 £1,435; To Dividends on the 7 per cent. Preferenco Shares paid Septemher, 1901, and March, 1902 £630; To Final Dividend on the Ordinary Shares of 4½ per cent (free of Income Tax), making 8 per cent for the year £1,845; To write off the Capital Expenditure incurred during 1901 £429 9s 3d; To carry forward to next Accounts £228 10s 1d.—Total, £4,567 19s 4d.

The results for the season are disappointing, the shortage as compared with previous accounts being due principally to continued unsatisfactory markets.

The adoption of a system of finer plucking on the Company's estates has also occasioned a considerable skrinkage in the crop of tea secured, which amonnted to 795,098 lb, against 899,806 lb in 1900.

In addition to the above, 63,583 lb of tea were manufactured for others, thus giving a total output from the Company's factories of 858,681 lb for the season.

The average yield per acre was 466 lb, against 523 lb. The rate of exchange was 1s 4⅜d, against 1s 4 27-64d, and the prices realised in London and Colombo respectively for the Company's tea averaged 7·08d and 30¼ cents, against 6·94d and 30¼ cents for the previous year.

The cinchona bark harvested during the year amounted to 45,108 lb.

The Company's acreage remains unaltered at a total of 1,963 acres, of which 1,720 acres are under tea cultivation.

The periodical reports from Mr Kerr, the Ceylon Manager, continue to be of a satisfactory nature, and the Directors take this opportunity of acknowledging the services of the Company's staff, both in Ceylon and London.

In accordance with the Articles of Association, Mr R W Forbes retires from the Board, and, being eligible, offers himself for re-election.

Mr James B Laurie, C.A., also offers himself for re-election as Auditor.—H L FORBES, *Chairman.*

London, 30th April, 1902.

THE IMPERIAL CEYLON TEA ESTATES, LIMITED.

REPORT OF THE DIRECTORS

to be submitted at the annual ordinary general meeting of shareholders to be hold at the Company's Offices, 9, Fenchurch Avenue, London, E. C., on Friday, the 9th May, 1902, at 3 p.m.

The Directors now beg to submit the balance sheet and profit and loss account for the year ending 31st December, 1901.

The Nett Profit, after payment of Debenture and other Interest for the year, amounts to ..	£4,062 11 11
To which has to be added the balance brought forward from 1900	234 17 4
	£4,297 9 3

This the Directors propose to deal with as follows:—(1) In writing off from cost of properties, as depreciation of Machinery, &c, £500; (2) In payment of a dividend of 3 per cent (free of Income Tax) on the paid-up share capital of the Company £2,700; (3) In carrying forward to next year the halance of £1,097 9s 3d. Total £4,297 9s 3d.

The following table gives the acreage, and results for the year:—

Estate.	Acreage in full and partial bearing.	Tea Crop, lb.	Yield per Acre.	Cost of Crop per lb. in cents.	Nett price realised per lb., in pence.	Working Profit.
Binoya	526	192,285	366	28·22	5·75	1,059 11 9
Edinhurgh	362	211.257	584	27·85	7·60	3,489 13 11
Friedland	161	50,240	312	34·92	7·56	399 14 10
Mottingham	221	101,700	460	28·97	5 52	352 0 7
St. Vigeans	185	66,314	358	33·84	6·62	315 16 8
	1,455	621,796	427	29·36	6·58	5,616 17 9
Nonpareil	175 / Bt. leaf	19,985 / 5,961	—	—	—	loss 332 6 3
	1,630	647,742	427	29·36	6·58	£5,284 11 6

The resnlt of the season's operations compares favonrahly with the previons year, and is largely dne to the greatly increased profit from Edinhurgh estate. Binoya has also doue well, whilst the deficiency arising from the working of Nonpareil is mnch less.

The total acreage of the estates as on 1st January, 1902, was as follows:—

Acreage under Tea.

Estate.	Tea in full bearing.	Tea in partial bearing.	Tea not in bearing.	Total.	Coffee and Cardamoms.	Forest, Reserves, &c.	Total Acreage.
Binoya	441	85	—	526	—	403	929
Edinburgh	362	—	48	410	—	40	450
Friedland	161	—	—	161	—	2	163
Mottingham	212	9	—	221	—	37	258
St. Vigeans	185	—	—	185	—	—	185
Nonpareil	50	125	134	309	44	196	549
	1,411	219	182	1,812	44	678	2,534

In accordance with the Articles of Association Mr. W Megginson retires from the Board at this meeting, and, being eligible, offers himself for re-election.

Messrs. W B Peat & Co., also offer themselves for re-appointment as Auditors to the Compnny.—By order of the Board,

W. H. BARTLETT, Secretary.

London, 29th April, 1902.

RANGALLA TEA CO. OF CEYLON.

REPORT OF THE DIRECTORS

for the year ending 31st December, 1901, to be submitted at the annual general meeting of Share-

holders, to be held at the Offices of the Company, on Thursday, 8th May, 1902, at 12 o'clock noon.

The Directors beg to submit the Balance Sheet aud Profit and Loss Account for the year 1901.

The uet profit for the year amounts to ...	£1,668	15	9
To which has to be added the balance brought forward from 1900 ..	412	12	7
	£2,081	8	4

An Interim Dividend of 2 per cent was paid on 19th Sepember, 1901, absorbing £440: And the Directors now propose to deal with the balance as follows:—1. In writing off from cost of Properties, as Depreciation of Machinery, &c. £1,000, 2. In payment of Final Dividend (free of Income Tax) of 2 per cent (making 4 per cent for the year) £440; 3. In carrying forward the balance of £201 8 4. Total £2,081 8 4. per lb. of 6·49 pence, as against the cost of 5d., or 28·53 cents per lb. f.o.b. Colombo. Exchange for the Company's drafts during the year has averaged 1s. 4 17-32 d. as against the exchange for 1900 of 1s. 4 39-64 d.

The following table gives the acreage of the estates for the last five years:—

	1897.	1898.	1899.	1900.	1901.
Tea in full bearing ..	591½	591½	591½	673	673
Tea in partial bearing ..	63	90	90	22	43
Tea not in bearing ..	61½	34½	34½	21	—
Cardamoms	56	56	56	46	36
,, not in bearing ...	—	10	14	38	38
Grass and Fuel Timber..	25	25	25	25	10
Forest and Waste Land ...	444	434	430	416	441
	1,241	1,241	1,241	1,241	1241

The following is a Statement of the Tea and Cardamom Crops, with the yield of Tea per Acre for the same period:—

	Tea lbs.	Cardamoms. lbs.	Yield of Tea per Acre. lbs.
1897 ...	212,555	8,291	360
1898 ...	206,620	4,026	349
1899 ...	211,361	4,211	357
1900 ..	218,572	1,828	325
1901 ...	230,002	3,119	342

The Estimates for the current year are, with purchased leaf, 265,000 lbs., and 3,000 lbs. Cardamoms, which, with 30,000 lbs. Tea to be mannfactnred for a neighbouring estate, will give the Factory about 300,000 lbs. Tea to deal with during 1902.

Mr Young has just retured from Ceylon, and reports favourably on the Company's properties. The plants are looking healthy and in good heart, whilst the Factory is ample for all requirements, and well equipped with machinery. Another roller may be necessary towards the end of the year if the output of Tea comes up to expectations.

Mr. William Keswick, M.P., retires from the Board, in accordance with the Articles of Association, and, being eligible, offers himself for re-electiou.

The Auditors, Messrs W B Peat & Co., also offer themselves for re-appointment. By order of the Board, London, April 30th. W. H. Bartlett, Secretary.

SPRING VALLEY COFFEE COMPANY, LIMITED.

Directors.—Messrs Alfred Brown, (Managing Director) Leon Famin, P C Oswald, J G Wardrop. Secretary.—J Alec Roberts. Offices.—5, Dowgate Hill, London, E.C.

Report.—To be presented to the Thirty-eight Ordinary General Meeting of the Company, to be held at No. 5, Dowgate Hill, London, on Thursday, the 15th day of May, 1902, at 12-30 o'clock p.m.

The following Annual Accounts are now presented to the Shareholders, viz.:—Balance Sheet made up to 21st December, 1901 Profit and Loss Account for the year ended 31st December, 1901.

The crop of Tea for the past season amounted to 612,026 lb, and this, together with 5,816 lb brought from neighbouring estates and manufactured at Spring Valley, sold for £18,525 18s 3d.

The crop from the few remaining Coffee trees amounted to 47 cwt 2 qr 3 lb, and realised £184 6s 0d, being at the rate of 77s 7d per cwt, against 68s 2d obtained for the 1900 crop. Coffee sold in Ceylon to the value of £37 12s 0d.

The total proceeds from the sales of produce amounted to £18,747 16s 3d, and expenditure in Ceylon and London to £16,915 9s 4d, leaving a profit on the year's working of £1 832 6s 11d. To this profit has to be added a sum of £627 18s 2d, brought forward from last Account, and after debiting £90 1s 6d for Income Tax and £900 for Dividend on the Preference Share Capital for the 12 months ended 31st December, 1901, there remains a balance of £1,470 3s 7d to be now dealt with.

The Directors recommended the payment of a Dividend of 1½ per cent on the Ordinary Capital, which will absorb £1,200 of the above sum, and that the balance of £270 3s 7d be carried forward to next year.

The weather during the past year was not favourable to flush. and the crop only reached a yield of 408 lb of made tea per acre against 482 lb previously. The coast of production was consequently higher, being 29 cents f.o.b. Colombo, which compares with 26·28 cents for the year 1900.

The unfavourable season and also finer plucking on many Estates resulted, however, in shorter crops both from Ceylon and India and a better price was secured for our produce, the average being 7·19 pence against 6·81 pence for the preceding year.

Cultivation and manufacturing appliances on the property have been well maintained and crop is at present coming in freely.

The future depends upon market conditions, and these should improve, as while consumption continues to increase both at home and abroad, further planting of tea on a large scale has ceased.

The area of the estate as on 31st December, 1901, was as follows:—

TEA.			
5 years old and over ..		1,521	acres
Planted Nov./Dec. ..	1897	194	do
Do ..	1898	196	do
Do ..	1901	10	do
Total under Tea ..		1,921	do
Total under Fuel ..		163	do
Forest, &c. ..		257	do
Oolanakande Estate		365	do
Total Area ..		2,706	acres

Mr J G Wardrop, a member of the Board, retires on this occasion, aud, being eligible, offers himself for re-election. Messrs Deloitte, Dever, Griffiths & Co., the Auditors, also offer themselves for re-election.

By Order, J. Alec Roberts, Secretary.

London, 5th May 1902.

PACIFIC PHOSPHATE COMPANY.

Pacific Phosphate Company, Ltd. (73,481).—Registered April 18th, with capital £250,000 in £1 shares (125,000 preference) to adopt an agreement with the Pacific Islands Company, Ltd, to prospect, search, examine and explore any territories for phosphate, guano, carbonate of lime, phosphate of lime, nitrate, alumina, oxide of iron and similar substances or products and other

fertilising deposits and substances and to carry on the business of miners, refiners, distillers, manufacturers, exporters and importers of and dealers in such substances as aforesaid and any chemical or other preparation, whether liquid or solid. The subscribers are :—

Registered by Ashurst and Co, 17, Throgmorton Avenue, E C.—*Investors' Guardian*, April 26.

PLANTING NOTES.

TEA-PACKET WORK IN AUSTRALIA—we learn from Mr. Edward Drummond, of one well-known Melbourne tea firm, Drummed Brothers, can be done in Australia about as cheaply as in Ceylon. It is not because the labour per hour is as cheap, but because the white labour works so much faster and more continuously than black.

BRITISH CENTRAL AFRICA.—In our daily and *TA.* will be found our latest notes from British Central Africa, which have taken two months to reach us. Though the country has not been progressing but rather the reverse, the last year or two, the advent of the railway brings a brighter prospect and it is hoped to develop the neighbouring markets to the south, for B.C.A. products—coffee, rubber and ivory.

THE NUWARA ELIYA TEA ESTATES COMPANY'S REPORT—is an interesting document. Beside 6 per cent being paid, nearly £1,800 is carried forward, and the Directors and Superintendents are to be congratulated. Of the estates Hethersett has the biggest planted acreage (370); while Pedro (488) has the largest total, and total crop, 261,223 lb. Park (560 lb.) gave the top yield per acre; Naseby, 9·13d the top nett price per lb.; and Park, £7 16 7d gave most profit per acre.

PEARLS AND PEARL OYSTERS.—We draw attention to the interesting contribution given under this heading from the pen of Dr. Andrew Wilson on another page. The theory started by Dr. Jameson may turn out to be of considerable practical importance in connection with Dr. Herdman's investigation, and we have no doubt the discovery will come under the attention of the latter distinguished scientist while he is in England.

BALATA.—In the annual report of British Guiana it is shown that the production of balata has risen from 237,824 lb of a value of £12,231, in 1899 to 1900, to a total of 425,371 lb of a value of £19,585, in 1900 to 1901. A large tract of virgin bullet tree forest were discovered and the industry is in a very healthy condition at present.—*India Rubber Journal*, April 28.

THE TEA CROP FROM THE FAR EAST.—Mr. Tchokoff, in the address we reproduce elsewhere from our contemporary, indicates that that the tea crop at Hankow will not be any bigger this year—unless the reduction of the export duty is going to have any effect. Further we publish news today of recent injury as to the Japan tea crop. If all this proves true, it should go to assist Ceylon and India with what is more than likely to be a bigger output in 1902 than in 1901.

THE REDUCTION IN CHINA'S TEA DUTY—by ½d per lb.—is the result of the Commissioners' memorial to the Throne, regarding which *The Times'* Shanghai correspondent wired on April 19th, a message we quoted two days ago. The export duty at present is, we believe, 2½ taels per picul—or 7s 3d per 133⅓ lb—which works out at rather less than ⅝d per pound. The reduction therefore leaves the tax barely ⅛d per pound. This should assist the China tea exports—which sank by 72,204 and 13,373 piculs, in black and green respectively, in 1900 from the exports of 1899.

RATE OF GROWTH OF SAL (AND OTHERS.)—The THINNED AND UNTHINNED AREA TREES figures which Mr Dickinson was kind enough to communicate in the December number are, I think, likely, in their bare nakedness, to lead many people astray, and for that reason I should have been glad if Mr Dickinson had explained just what value he himself puts upon them. The *correctness* of the measurements is not in dispute, but their *application*. Personally, I rejoice that various considerations "make it impossible to thin such forests at an early age." Nobody doubts the greater rapidity with which *girth* is acquired by isolated or semi-isolated trees as compared with stems grown in close canopy. The *volume* per tree is also no doubt greater for a smaller number of trees. I am also aware that the *total soil production* has been alleged to increase by means of thinnings. But here I begin to boggle, and I refuse decidedly to take the jump that leads to open crops from their youth up. Open crops mean grass on the ground. Grass in sal forest is proof positive of a lot of sunlight wasted. How can the soil production then be said to increase? In any case, youth is the period for the upward struggle. *Tall and upright* should be our watchwords. When we have got the maximum possible of length and straightness it will be time to go in for girth, but not before. Not knowing the plots, I cannot discuss the figures; but, in any case, I am not prepared to accept the rates of growth deduced as in the least representative of the difference between an unthinned crop and one thinned with due caution. The very constitution of a selection forest is opposed to correct results, such a forest be in more or less in a chronic thinned condition. One-aged crops are the only ones capable of giving true results in regaard to effects of thinning

F. GLADOWE.

CARRITT & CO.'S INDIAN TEA MARKET REVIEW.

SEASON 1901-1902.

Calcutta, April 1902.

The season has closed with an actual crop of 175¼ millions, of which 153 millions have been exported to the United Kingdom; the corresponding figures for last year were 187½ and 161 millions respectively.

The shortage in outturn, as compared with last year, has amounted to about 12 millio s; Assam made 2¾ millions, Cachar 4½ millions, and Sylhet 4¼ less; other minor districts also contributed to the shortage. The Dooars' crop weighed out about ½ million more than last year; this is accounted for by the recent extensions coming into full bearing; on last year's area of mature tea this district would have been appreciably behind in outturn. The yield from Darjeeling was practically the same as last year.

The quality of the crop, as a whole, has been good and above the average. Assam sent excellent teas forward up to September when quality fell away, and the concluding week's manufacture was disappointing, there being a very noticeable dearth of true autumn-flavoured tea. Cachar and Sylhet have supplied clean useful types, and the teas have shown a marked improvement, both in respect of appearance and liquor. The Darjeeling crop has been fully average, the proportion of really fine tea has, perhaps, been smaller than usual, but on the other hand there has been less of the thin pointless types. Dooars and Terai, especially the former district, have sent forward particularly good crops; they have been the best seen for a number of years.

A few Nilgiri teas have found their way to this market, and we believe sellers have been well satisfied with the result of their venture. There is always a demand here for these types, particularly the higher quality kinds, and there is room for freer supplies. An invoice from "Daverashola" was very well received towards the close of the season.

The market features of the past year have been the higher range of prices at which low grades have been selling, and the proportionately low level of value of all teas above this category, but more especially the higher grades; the one movement is collateral with the other, and is attributable to a smaller supply of common tea.

The past year will be remembered as one of unusual importance in the history of the industry; twelve months ago the effects of an over-abundant supply of indifferent tea were being keenly felt and prospects for the approaching season were anything but bright. The position at the moment is very different, nevertheless the crisis through which the industry has been passing cannot be regarded as over. The improved conditions and outlook are solely attributable to the production of a smaller and better quality crop brought about by a more careful system of plucking and considerably assisted by climatic influences.

Growers are to be congratulated upon their determination and self-restraint shown in the matter of curtailing supplies and improving quality. During the early months of the season there was much to dishearten them; it was an exceptionally late opening, and outturns fell appallingly behind the average for a number of years. In addition to this the markets took some time to respond and no compensating advance in prices was immediately seen.

It was not until the season had well advanced that tea hardened in value, but with a consistent shortage in supplies this movement became accentuated and the average level of value of Indian tea is now about ½d. better than at this time last year,

It cannot, however, be said that the working of the past season shows uniformly better results to producers than last year. The course of the markets has not treated individual interests alike; generally speaking, advantages have been counteracted by drawbacks and no real benefit has yet been gained. Low grade teas have advanced in value, but gardens producing them lost most heavily in outturn; the value of medium grades upward has not risen to any appreciable extent, but though short crops have been made they have not weighed so heavily in the balance. The advance in value has been chiefly confined to the lower grades, and Assam gardens particularly may be disappointed with the comparatively small recovery in prices so far shown.

The tendency, however, is in the right direction. There is very clear evidence of prosperous times ahead and not so far distant. The action of growers during the past season has undoubtedly averted a crisis in the industry; they now find themselves in a stronger position at the close of a single season, with a brighter outlook for the future before th m, so long as they persevere in their determination to curtail outturn and improve quality. It is interesting and instructive to go into figures and get some idea of what the conditions might have been, had the industry failed to recognise its serious position before a start was made on the past year's crop. Owing to the absence of outturn and export figures of the crop from Southern India, it is difficult to compile an absolutely accurate estimate, but a very fair idea can nevertheless be formed from details at hand. It is probable that, had similar conditions of weather and manufacture existed in 1901-1902 as in 1900 1901, the quantity to be accounted for through Calcutta would have totalled 192½ millions, of which about 166½ millions would have been shipped to the United Kingdom. This heavy crop would have had much the same effect on prices as in 1900. By reason of unfavourable weather, however, and more careful plucking, the actual crop and shipments to the United Kingdom have been reduced to the much more moderate limits of 175¼ millions and 153 millions respectively.

From now onwards the industry should realise the vital importance of keeping the crop within reasonable bounds, and particularly during the ensuing two to three years, as the period is now being passed when large extensions, made a few years ago, come into full bearing. Weather was abnormal last year, and played a very important part in levelling down supplies, and it cannot be expected to have the same influence for some time. The position must therefore be met by strict adherence to careful plucking. The producer has recovered considerable strength during the past twelve mon hs and he will continue to do so, provided the markets are fed judiciously; breathing time will be given to enable demand to come abreast of supply and it will not be long before "Tea" will offer as sound an investment as can be found. The past two

years have furnished excellent examples of opposite workings. Season 1900-1901 with its heavy crop of indifferent quality gave a result little short of a crisis, the market became clogged and prices tumbled away below bedrock level; the evils continued their effects into season 1901-1902, but were counteracted by smaller supplies and improved quality, and before many weeks had passed there were signs of recovery which have since developed into a quotable advance in the average price of all tea. The coming season can be viewed with confidence so long as the outturn continues on a moderate scale. Although weather is not likely to tend to check supplies, its place will be taken by scarcity of labour which is now occupying the serious attention of producers. The flow of labour from the recruiting districts has been seriously checked, chiefly by recent Government restrictions; and the difficulty in obtaining coolies is, perhaps, greater than had ever before been experienced: it is doubtful if gardens have secured half their additional requirements for their labour force, and this will undoubtedly have its effect on outturn. Circumstances are all in favour of a moderate output; the past year's experience has infused a determination amongst growers to continue on last season's lines, and the labour difficulty, and abandonment of non-remunerative areas, which is considerable, will have a material effect in curtailing the supply.

The conclusions which may reasonably be drawn are that the approaching year's crop will again be a moderate one, and no large increase on last year's export is likely to take place, while a very much greater off-take by new outlets may be anticipated if the local market is more liberally supplied.

In our last annual review we remarked as follows:

"As regards the outlook and prospects for the future it may be said that the position is almost entirely dependent upon the attitude of growers during the coming season. The remedies for dealing with the present depression are in their hands, and they have only to make it evident that they are determined to curtail outturn, improve the standard of quality and devote more attention to the demands for new outlets to bring about more prosperous times."

It has been seen that endeavours to reduce supply and improve quality have been, with the assistance of weather, successful; but no headway, however, has been made towards fostering the demands for outside markets. Only 46¼ millions have been sold in Calcutta during the past year, which shows a falling-off of 3¾ millions in the supply to this market; a short crop in some measure accounts for this, but not entirely and, it is once more apparent that the importance of studying the requirements of new outlets is not yet realised. For some years past we have urged the necessity of a free supply to Calcutta, and at the conclusion of each season have shown the strength of outside demands, their relation to the supply and the disappointment that must eventually follow a continued disregard of them. The season just closed indicates that Indian tea has lost ground in the markets of the world outside the United Kingdom; from year to year they have increased their trade, until in 1900-1901 they absorbed half the offerings in Calcutta, and there is no doubt that further expansion would follow an increasing supply; on the other hand, a retrograde movement must occur if the course of supply becomes underfed.

This is what has really happened during the last twelve months. Calcutta sales have shown a falling-off of 3¾ millions, and outside trade shows 4½ millions decrease. There are now no obstacles in the way of extending our connection with foreign markets; shipping facilities to all parts of the world have marvellously improved of late and the only explanation lies in the reduction of supply on the Calcutta market. The various demands for tea, however, exists and are increasing rapidly, but Ceylon is reaping all the benefit; she is not only getting the increase but is also cutting very seriously into our trade by reason of the better handling of her crop.

In contrasting the two markets last year we remarked:—"As Ceylon increases her business with new markets, so in like proportion is the supply and selection in that market increased by producers. Why should India continue to do the exact opposite?"

The following is an interesting comparison of the two markets:

CEYLON.

	Total Crop. millions.	Offered in Colombo. millions.	Shipped to outside markets. millions.
1901	146¾	51	40
1900	148½	48	34½
1899	130	38½	25½
1898	119¾	36	23¾
1897	116	33¾	17
1896	108	32	14¼

INDIA.

	Total Crop. millions.	Offered in Calcutta. millions.	Shipped to outside markets. millions.
1901	175¼	46¼	20¾
1900	178½	50	25
1899	174¾	50	22
1898	154	49	17¾
1897	148¼	46	13
1896	135½	47¾	13

In the six years it will be seen that Ceylon's outside trade shows an increase of 25¾ millions, and her offerings to meet it have increased 19 millions without a pause from year to year.

During the same period India's outside trade has increased 7¾ millions; her offerings, however, have been irregular, and for three consecutive years were stationary while last year they were actually 1½ millions less than five seasons ago when the total crop was 40 millions lighter. The whole of the increase in the crop from India from year to year has been forced on the London market, and no portion of it has been seen in Calcutta. Ceylon shows a very different record in 1899 and in 1900 her crop increased 18½ millions, but only 10 millions of it went to London, the remaining 8½ millions being offered in Colombo. In 1901 her crop was less than the previous year, yet she recognised the advantages in obtaining on the local market and gave it 3 millions more.

Comparing the two centres again, Colombo placed 44¼ per cent of its supply in new markets in 1896, and nearly 80 per cent in 1901; while Calcutta figures are 27 per cent and 44¾ per cent respectively.

The indications last year correspond to those in 1896 and 1897 and are unmistakeable; supplies showed a decrease in all three years, and exports were either less or could make no headway.

Ceylon has therefore gone ahead so rapidly that her local offerings last year were nearly 5 millions more than Calcutta and she has diverted from London just about double as much as India; she thus

feeds and fosters her new outlets carefully and in doing so affords relief to London, providing for a reasonable supply and a healthy tone to that market. She is a long way ahead of us. In 1900 her offerings were 2 millions less than Calcutta, while in 1901 they were nearly 5 millions more.

The distribution of the crop from Calcutta compares with recent years as follows :—

	1901-1902. millions.	1900-1901. millions.
To United Kingdom	153	161
To Colonies	8½	10½
To America	2¼	4½
To other outside markets	10	10

	1899-1900. millions.	1898-1899. millions.
To United Kingdom	149¼	133¾
To Colonies	8¼	6¼
To America	6	3¼
To other outside markets	7¾	8¼

The disappointing figures have been explained. Russia has now made Calcutta a regular market for obtaining its supplies. It is capable of drawing large and increasing quantities and is one of the best fields for an extending trade.

The quantity taken by outside markets from Calcutta sales has amounted to 20¾ millions which is equal to 44¾ per cent of the total offerings. Last year the proportion was 50 per cent., and the year before 44 per cent. Comparative details are as follows :—

	1901-1902. mills.	1900-1900. mills.	1899-1900. mills.	1898-1899. mills.
Total quantity sold in Calcutta	46¼	49¾	50	49
Percentage of above exported to Colonies ..	18½%	21¼%	16½%	13½%
Percentage of above exported to America ..	4¾%	9%	12%	6¾%
Percentage of above exported to other outside markets ..	21½%	20%	15½%	17%

The Port Commissioners have now before them a scheme for improving the present facilities for handling tea in Calcutta, whereby the work can not only be considerably accelerated, but a matrial reduction in charges is also expected, and a better preservation of the condition of packages. Such improvements are needed more especially in respect of arrangements for ensuring greater expedition in the simultaneous handling of incoming and outgoing teas ; the present system necessitates numerous handlings, and at times an exceptional strain is placed on the existing available resources of the warehouse.

The transfer of warehousing accommodation from the centre to the outskirts of the city, however, may interfere with the expeditious working of Calcutta sale teas unless reliable provision is made for continued and easy access to the warehouse, and it is to be hoped this important matter will receive careful consideration for otherwise the working will not be successful.

The following is an extract from a circular having reference to this matter :

"The Port Commis-ioners have now under consideration a comprehensive scheme for the provision of suitable berths at the docks, to which the inland vessels would proceed direct on their arrival in Calcutta and discharge their cargoes by means of special appliances into a warehouse, where the tea might be stored whether for sale in Calcutta or London. Consignments when ready would be passed on from this warehouse direct to the berths of ocean steamers. The object of the scheme is to give despatch and at the same time reduce the handlings, thus cheapening the cost and avoiding the damage and waste, which must be sustained when such articles as chests of tea are subjected to repeated removals. The new tea warehouse would be equally accessible to the railways. The handling of tea from the time it left the Inland vessel or railway wagon, until it was in the Ocean steamer's hold would be reduced to a minimum, whether it was tea for sale in Calcutta or London. As the handling of Calcutta and London teas, under the proposed scheme, would practically be the same, there would always be the option of selling the tea without extra expense, in whichever market suited best for the time being. The present tea warehouse would be used for other purposes. Should the scheme go through, arrangements would be made for conveying by train once or twice a day the representatives of the Tea Brokers and Agents to the Docks."

The duty question has once more engaged the attention of the trade, but, although it has been responsible for disappointing markets, it has fortunately not been productive of such serious disorganisation as attended the scares of the last two years. Strong representations have been made to the Governments, and it is fervently hoped they have been successful in convincing the powers that be that tea has reached the utmost limit of taxation. Even as it now stands, the impost of 6d per lb is comparatively unfair, and a further increase would invoke a strong feeling of iniquitous legislation, while so many other products remain unburdened. A further increase in duty could not be borne, it would come as a fatal blow to the industry, and at a time when, through its own endeavours, it was overcoming difficulties and a more hopeful future might reasonably be anticipated.

The past year has seen a definite start made in endeavouring to increase the consumption of tea in India. Messrs. Andrew Yule and Company have been appointed Commissioners, and considerable assistance has been given in contributions of cash and tea by the Indian Tea Association and the producing community. The object of the scheme is to put supplies of sound honest tea within easy reach of all classes, and at the same time to relieve the markets of an appreciable portion of the yearly supply. It is unusually comprehensive and every possible outlet in the Empire is being energetically tapped. The Advisory Committee and Commissioners are to be congratulated upon the excellent results already shown. The movement has been in existence but a few months and up to the present about 6½ lakhs of pice packets of dry leaf and 1½ lakhs of cups of brewed leaf have been turned over. The total quantity distributed in various ways is about 2,500 chests. This progress is doubtless beyond expectation, and as the scheme is being thoroughly worked through the proper channels its success seems assured and the offtake through this source, will soon afford material relief to the markets. It is to be hoped the Commision will be loyally supported by producers, as they undoubtedly should, so that the good start made may be carried through to a successful issue. A memorial, praying for the sanction of an export duty on all Indian tea, has

been presented to His Excellency the Viceroy and his reply is anxiously awaited. The export duty or cess is asked for at the rate of one-fourth of a pie per pound, the infinitesimal equivalent in sterling being one-twelfth part of a farthing. On the total export, however, this assumes the very considerable proportions of about 2½ lakhs of rupees, or nearly £17,000 sterling. It is desired to utilise this amount for the purpose of increasing the consumption of Indian tea in India and other countries outside the United Kingdom. The memorial is a fully presentative one, being signed by those interested in almost 400,000 acres, and it is to be hoped His Excellency's reply will be favourable. The cess will correspond to that which has been in existence in Ceylon for about eight years.

The foregoing remarks will help to convey some impression in regard to the coming year's outlook which is again chiefly dependent upon the policy of growers, but unlike last year they can count upon freer working markets in all parts, occasioned by more or less moderate stocks, and no locking up of capital in London to any great extent. Home stocks appear somewhat heavy on paper, but last year's figures were exclusive of the heavy clearances from bond made in anticipation of the Budget, which were held by dealers and occupied their attention for many months. The present position, however, should not be regarded as any inducement to free plucking and increasing of supply: such action would be extremely unwise and the industry would immediately lose all the advantage gained during the past twelve months.—*Indian Gardening and Planting*, April 24.

TRADE AND NAVIGATION OF BRITISH INDIA.

FOR THE 12 MONTHS, 1ST APRIL 1901 TO 31ST MARCH 1902.

TOTAL TRADE TEN TIMES THAT OF CEYLON.

LARGE EXPORT OF PEPPER, CHILLIES AND GINGER TO THE VALUE OF 7½ MILLION RUPEES.

COFFEE KEEPING UP;—FALLING-OFF IN EXPORT OF RUBBER.

On 20th instant we received from the Government of India, its full Customs Accounts for the year ended less than two months ago. This is expeditious work. The grand total for

the Import trade is	...	R1,011,189,172
and Export trade	...	1,325,565,619
Grand total	...	R2,336,754,791

But the above includes gold and silver imported (over R196,000,000) and exported (over R84,000,000)—and deducting these, the total of "Merchandise" was as follows:—

		R.
Imports ...	...	814,705,376
Exports ...	...	1,208,336,706
Total	...	R2,023,042,082

It is interesting to compare our Ceylon figures with the above:

		R.
Imports (without Specie) 1901	...	104,050,030
Exports ,, ,,	...	85,977,410
Total	...	R190,027,440

So that our annual Ceylon trade is less than one-tenth that of India. This is a wonderfully good comparison however, when the population and size of this little island are contrasted with that of the big continent. One curious point is the preponderance of value in Exports in the case of India, while the reverse is found in Ceylon. We suspect the Customs valuations for Exports are more liberal in India than here; for, of course, the rates applied here are nominal and below real values. At the same time, Ceylon is still to some extent, though slightly now, a distributor of imports, and therefore gets more than she consumes.

Among interesting details is the fact that India imported 12½ millions coconuts last "year" against 17½ in 1900-1. Of betel-nuts she took 9½ million lb. in 1901-2 from Ceylon valued at R1,517,521. The Straits gave India seven times this quantity; but the value is less than three times. Can the Ceylon betel-nut be worth more than twice that of the Straits, although the very name "Penang' means the home of the betel-nut? Who will clear up the mystery.—Of Cloves, Pepper and other Spices, India also imports, but only to a fraction of her exports. Here is a grand show in this department (in which Ceylon is far behind, even in supplying its own wants):—

		1901-02	1901-02
SPICES—		lb.	R.
Cardamoms	..	144,792	225,493
Chillies	...	9,806,416	958,719
Ginger	...	5,758,616	1,302,323
Pepper	...	13,589,172	4,801,554
Other sorts	...	514,814	120,180
Total	...	29,813,810	7,408,269

We may as well also give the full official return for tea exports:—

		1901-02	1901-02
TEA—		lb.	R.
To United Kingdom		159,014,075	73,905,206
,, Russia	...	1,624,580	537,496
,, Canada	...	1,059,483	412,125
,, United States	...	1,080,293	385,736
,, China—			
Hongkong	...	1,111,192	418,767
Treaty Ports	...	225,452	48,939
,, Persia	...	2,530,546	1,141,549
,, Turkey in Asia	..	2,626,130	1,008,133
,, Australia	...	8,575,036	2,913,010
,, Other Countries	..	1,838,145	723,932
Total	...	179,684,932	81,494,893

Tea showed 175,038,127 lb. exported in 1899-1900; and 190,305,490 in 1900-01.

It is interesting to note how wonderfully well the export of coffee keeps up:—255,042 cwt. in 1901-2 (of which curiously enough 100,777 cwt. went to France) against 246,431 in 1900-01; and 281,533 in 1899-1900. Cinchona Bark, Caoutchouc (Rubber) and

Tea Seed go steadily down, however, in the exports:—

	1899-1900	1900-01	1901-02
Cinchona Bark, lb.	3,290,236	2,753,858	1,917,250
Rubber, cwt.	8,169	7,698	4,136
Tea Seed, cwt.	1,659	1,121	647

We may add that Cardamoms which were shipped last year to 144,792, lb.gave 191,12) lb. in exports in 1899-1900; but only 123,254 lb. in 1900-1901. The fact is that the Presidency towns offer a splendid consuming market for Cardamoms and all Spices and it is a wonder any are shipped to Europe.

NEW COMPANY: TO DISTRIBUTE TROPICAL PRODUCTS.

ASSURANCE TRADING CO., LTD. (73,408).—Registered April 12th, with capital £50,000, in 49,500 ordinary shares of £1 each and 10,000 finders' shares of 1s each, to carry on by wholesale and retail the business of tea, coffee, cocoa and chocolate dealers and blenders, general grocers, provision merchants, dealers in foodstuffs, distributors of gifts, bonuses and benefits to customers, planters and growers of tea, coffee, rice, cocoa, cinchona, tobacco, indigo or other produce, farmers, graziers, cattle dealers, millers, storekeepers and general merchants. The subscribers are:

LUMINOUS TRAPS FOR INSECTS.

(From a correspondent.)

Le Phare Agricole "*Meduse*"—described and figured on the separate slip—would be the most convenient form for use in Ceylon. I have been using one (obtained through Mr. E B Creasy) for the last month. It is very simple and effective. I have proved it to be an excellent moth trap; but it has failed in the case of Helopeltis and Shotbole Borer, which pests do not appear to be responsive to the attractions of light. It ought to be possible to import these machines at a small cost. Cheapness is a *sine qua non*, if they are to come into general use on estates. For—to produce any practical result—a number of the lamps must be employed simultaneously, in different parts of the affected fields.

"COFFEE" TOBACCO: NOT OBNOXIOUS.

M Baral, a Frenchman, finds by experiments that while cigarettes made with tobacco are noxious to men and animals, those made with leaves of the coffee plant are inoffensive. Perhaps an English investigator will follow up the clue. What with American "combines" and cheap Virginia cigarettes there is ample room for a wholesome rival of tobacco.—*Globe.*

BRITISH NORTH BORNEO TOBACCO.

We are informed officially that, at the sale of 19,337 bales of Sumatra and British North Borneo tobacco, which was held at Amsterdam on the 8th instant, a parcel of 1,348 bales of North Borneo tobacco, grown by the New Darvel Bay Tobacco Company, fetched the highest average price—viz., 5s. per lb. for the lot, over £50,000.—London *Times*, April 10th.

RUBBER PLANTING IN MEXICO.

The president of the Tehuantepec Rubber Culture Co.—Mr H W Bennett—writing from their plantations, says: "Over 690 acres of and, which, six months ago, was heavy virgin forest, has been cleared and partially planted. With a large force of laborers employed, it is expected that this area will be more than doubled by the month of June, when all new clearings will be burned over, staked and planted (with the early July rains) with selected stock from our own nurseries. The soil is so exceedingly rich that it will readily support a much larger number of trees per acre than contemplated by our proposal to investors, and it is the purpose of the management to largely increase the number of trees to be planted, with the idea of cutting out (for profit) whenever the growth shall become too dense. This process is considered advisable, if for no other reason than to furnish proper shade for the trees which will later form the permanent plantation."—*India-rubber World*, April 1.

WILL OF MR. GEO. WHITE.

The estate of the late Mr. George Thomas White of Malvern House, Kenley, and of the firm of Messrs. George White and Co., 31, Fenchurch Street, E C, tea brokers, who died at the Mandeville Hotel on March 5, aged sixty-two years, has been valued at £29,194 11s 7d gross, and £28,423 5s 4d nett.—*H & C Mail*, May 2.

TROUT IN CEYLON.—We give some interesting particulars elsewhere regarding the trout fry at the Nuwara Eliya Hatcheries, and simultaneously Mr. John Fraser's letter, in search of truth and showing unreadiness to be convinced too easily that trout *are* breeding in Ceylon, is to hand. It is certainly a question that should be authoritatively settled by more than mere observation of the contents of streams; expert investigation is desirable. "A. J. M." unfortunately has gone a-coronating to Alexandra Park, or his assistance in identification of local-bred trout (whatever his gift be in this direction as regards authorities) might have been of some immediate service.

THE

AGRICULTURAL MAGAZINE,

COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for June :—

Vol. XIII.] JUNE, 1902. [No. 12.

VARIATION IN THE COMPOSITION OF COW'S MILK.

THE variation in the qualityof milk has perplexed many a dairyman. As a rule variation below the higher stand is attributed to adulteration ; and while it is certain that the instability of the standard is taken advantage of by the unscrupulous dealer in milk, the honest man is often unjustly blamed for what he cannot help, through the vagaries of his milking stock.

Those who are interested in this subject and are desirous of informing, themselves, instead of dogmatising in their ignorance, should carefully read the article by Mr. Herbert Ingle, F.I.C., of the Yorkshire College, Leeds, who takes up no less than thirty pages of the latest number of the Transactions of the Highland and Agricultural Society of Scotland in detailing the results of investigations into the inconsistent results as to the quality of milk under regulated treatment and feeding of cows.

The various points which were carefully considered in the investigation were (1) determination of fat, (2) determination of specific gravity, (3) period of lactation, (4) season of the year, (5) time and manner of milking, and (6) the effect of food.

The records given are interesting to those who have the care of milch cattle, but it suffices us to reproduce the general conclusions to be drawn from the results brought out by the practical investigation into the subject.

1. The percentage of fat in the milk of individual cows is liable to enormous variation from time to time, from causes which are unknown.

2. Morning milk is much poorer in result than evening milk, though slightly richer in solids not fat and more abundant. This statement applies to cases where the night interval is much longer than the day.

3. The percentages of fat and solids not fat in milk tend to diminish for two or three months after calving, and then steadily increase as lactation advances.

4. Foods rich in albuminoids seem to improve both the yield of milk and the proportions of fat and solids not fat, at least for a time, while large quantities of carbohydrates, though slightly increasing the yield, appear to diminish its quality.

5. The mixed norning milk of a herd may often fall below 3 per cent of fat in the late summer or autumn, if the milking be performed at the usual unequal intervals.

While the variations referred to under the heads 2, 3 and 4 are thus accountable and to some extent controllable, that referred to as being due to unknown causes must remain a very unsatisfactory element in the dairy industry. With this variation in the percentage of fat, will vary the specific gravity of milk, and to depend upon the lactometer as a gauge of the purity must lead to very erroneous conclusions.

It is to be hoped, however, in the interests of all concerned in the production of pure milk, that the mystery will be soon unravelled and the unknown causes that are responsible for sometimes lowering the quality of milk will, with the help of science, be eventually made known.

RAINFALL TAKEN AT THE SCHOOL OF AGRICULTURE DURING THE MONTH OF MAY, 1902.

The greatest amount of rainfall registered in 24 hours on the 21st May, 1902, 6·86 inches.

Recorded by ALEX. PERERA.

OCCASIONAL NOTES.

We publish in this issue an account of the cultivation of ground-nuts, of which a small crop has just been taken at the Stock Garden, from whence the seeds will be distributed to School Gardens. As we stated in our last issue it is surprising how little this plant is cultivated in the Island, in spite of its being so valuable a product for dietetic and other points of view.

About the middle of May we had the opportunity of inspecting the mangosteen plantation on Mr. J. Dassanayake's property at Bellana, where the mangosteen tree flourishes as luxuriantly as we have seen it do anywhere. At the time of our visit the trees were heavily laden with crop just coming into maturity.

We were struck a few days ago by the peculiar odour of chlorine gas in the gardens of the School of Agriculture, and were reminded of the fact that we had the same experience last year, as far as we remember about the same time. We have failed to connect the odour with some form of vegetation in the neighbourhood, but it may be that it comes from some neighbouring garden, as it seems to be brought by the wind at intervals. There is no reason for believing that the smell is due to decomposition. Have any of our readers had a similar experience, or do they know of any flowers emitting the peculiar odour referred to?

Of the fruits that are well suited to the very sandy soil of the "Cinnamon Gardens" of Colombo are the custard apple and the pine. A plantation of the latter has been bearing very well all through May, and there will be more fruit to gather in June. The custard apple trees ar just now in heavy bearing, and always bear good crops. The trees have been given a small dressing of rape manure which we have found good for all fruits. The great trouble with custard apples is to keep the fruit from being attacked by squirrels. Apparently nothing will force the orange into bearing in such a soil. Trees growing in the clay soils of the Matale district are worth looking at about this time.

SERICULTURE AN INDUSTRY FOR THE NATIVES OF CEYLON.

As long ago as August, 1896, a correspondent writing to the *Agricultural Magazine* made the following allusion to this subject:—It must be admitted that we have very few industries in the Island capable of giving employment to the native agriculturist, and especially to the members of his family during the time they have little work in the paddy fields. The Sinhalese cultivator is accused of apathy and gross laziness, but the average tillers of the soil cannot be expected to possess the knowledge and resources necessary for experiments in connection with new industries with a view to their adoption. No one will, however deny, that when he knows of an industry that is likely to bring him an income and will not interfere either with the cultivation of his field or with his liberty as a proprietor, he is not only ready to adopt it, but is capable of carrying on the work with success. Under these circumstances it surely behoves those who have the welfare of the country at heart to experiment in connection with and popularise such industries as will give employment to and draw forth the latent energies and capacity of a large number of the rural population. The improvement of the villagers' condition cannot be effected by the introduction of any industries which require large capital, and which will necessarily involve factory work and cooly labour. These will benefit the larger capitalists, but the material and moral welfare of the agricultural masses can only be improved by providing them with work that will not necessitate the sacrifice of their independence or the neglect of their holdings, however insignificant these may be. They must be encouraged to depend on themselves and work for themselves and not to work for others to the neglect of their land; and they must not be encouraged to congregate in manufacturing centres where with busy surroundings they begin to feel discontented, a condition which leads to much trouble. Under these circumstances the importance of home industries cannot be over-valued. Sericulture or the rearing of silkworms may prove to be one of the industries adapted to the peculiar circumstances of thevillagers. We say "may" because there are industries which though they appear likely to be suitable will eventually be found to contain some element which makes it impossible for the people to carry it on with success. This point can only be satisfactorily settled by one or more experiments, and there is no reason why such a trial should not be undertaken in Ceylon.

The history of the various attempts that have been made to establish the silk industry in Ceylon is thus summarised by the Editor of the Ceylon Handbook and Directory:—

There is a spot on the banks of the Kelani river 3 or 4 miles above the Bridge of Boats *en route* to Hanwella called "Orta Seda" (Sin. *Sedawatta*) or Silk Garden, where the Portuguese are believed to have fed silkworms. The Dutch unsuccessfully attempted to propagate the Silkworm plant (mulberry) trees, and produce Silk at Jaffna. (See Tennent, vol. I, page 265.) Tennent also notices the presence of the Tusser silkmoth which feeds on the country almond (*Terminalia Catappa*) and the very common *Palma Christi* or castor-oil plant; but nothing has been done with the Tusser to make it a commercial success. In the British period Bennett takes credit for introducing the white and digitated mulberry (as well as the opium poppy), and on 21st September, 1829, a Government regulation was passed to encourage the growth of "silk and opium" among other agricultural produce. He thought the Northern Province eminently adapted for the silkworm and mulberry plant, being the least humid part of the island; as Tennent thought it best adapted for the Tusser silk and castor-oil plant. Bennett gives instructions (page 217) for the formation of mulberry nurseries, and he quite hoped to see silk a staple of the north of Ceylon. He proposed shading the mulberry plant with plantains and afterwards to grow an undercrop of Indigo. Latterly, experiments with the true silkworm have been tried more than once, more particularly by a coffee planter in Haputale, on whose produce a favourable report was received, but the difficulty of securing careful skilled labour and the injurious effects of thunderstorms on the silkworms prevented the continuance of the experiment. Sir Wm. Gregory took a great interest in the Silk-growing, as in all other experiments with new products. In 1872 he reported that the "mulberry tree grows quickly and vigorously in Ceylon, and the worms are reported to be hardy and to thrive well, but the difficulty was to find patient and skilled hands to wind the silk." Accordingly he recommended the dried cocoon to be sent to Europe to be spun, but the cost of female labour in England is another difficulty. Sir Wm. Gregory introduced and distributed Japanese silkworm eggs in Ceylon. The late Mr. Bury of Golconda, Haputale, Father Palla at Galle and Mr. P.N. Braine in the Central and North-Western Provinces among others, took a special interest in silkworms, and, for a time, had a fair measure of success, also Mr. C. Ralston White in Haputale West and Mr. R. Fraser of Wariapolla. The Matale Agricultural Association (in July 1888) took steps at the instauce of Mr. E. Gordon Reeves to endeavour to establish Sericulture among the natives of the district. A good plan would be to establish groves of mulberry trees and a silkworm hut near every vernacular school as one means of technical instruction. It would be well if the Ceylon Government could offer a sufficient bonus for the production of an appreciable quantity of this and other new products which only require a good start to take root in the island, develope and prosper.

We have referred to this subject and summarised the information regarding sericulture in Ceylon, as it is now proposed by Mr. E. E. Green, the Government Entomologist, to make a fresh attempt to popularise silkworm rearing among our village population through the School Gardens that have lately been established. The proposal has the approval of the Director of Public Instruction, and already the Superintendent of School Gardens has made a start with the distribution of mulberry cuttings to school teachers. Thus the wish of our correspondent of 1896 and the suggestion of the Editor of the Ceylon Handbook and Directory will be given effect to, with what result remains to be seen, but with an already existing agency for the fostering of the industry, and under the advise of an expert in Mr. E. E. Geeen, the attempt to popularize sericulture as a home industry for the village population starts under fair auspices.

A FINE GAUVA.

Some time ago the *Bulletin of the Botanical Department of Trinidad* described under the above heading a variety of the gauva found growing in the suburbs of Port of Spain and known as the red or Cayenne gauva. The fruit is oval in shape and of an average size of 3⅝ in. in its longest and 2⅝ in. in its shortest diameter. It has fewer seeds than the ordinary kinds, and is filled with semi-solid red pulp in the interior. For making the celebrated Gauva Jelly of the West Indies it deserves to be widely cultivated. The weight of an average specimen is ·35 lb., thus taking seldom more than three fruits to the pound. The flavour is said to be excellent.

We are glad to state that we have received through the courtesy by Mr. T. H. Hart of the Botanic Department of Trinidad a packet of the seed of this gauva, and in writing Mr. Hart says: "I trust you may be successful in raising plants, as it is a variety well worth growing."

A NEW MANURE.

Mr. John Hughes, in a paper read before the Society of Arts made the following important statement:—"The time has come," he said, "when manures should be adapted to the soil, rather than that the soil should adapt itself to the manure. Obviously soils differing so much in their chemical composition and physical character as chalk and clay, peat and sand, granite and gravel, require different manures in the same way as they require different cultivation and different kinds of crops. It is not scientific, it is not economical, and it cannot be to the advantage of the farmer, that one kind of manure should be sold for application to all kinds of soils."

Such a pronouncement on the subject of manuring by a chemist who has had ample opportunity of judging of the value of manures and their effect on soil, deserves to be carefully considered by us. In this country, the practice of employing chemical fertilizers is of recent date, and where here has been little opportunity for growers to

acquaint themselves with the character and action of special manures in their various forms, there would naturally be a tendency to a careless use of them, careless in the sense that their use is not based upon a definite knowledge of the substances employed. A perusal of Mr. Hughes' paper and the discussion that followed thereon will show how, even in England, the question of economical manuring is still far from settled.

Mr. F. J. Lloyd, another authority on chemical questions, speaking at the same meeting gave it as his opinion that the time had come when some authoritative body should lay down a definite standard which could be accepted universally as a means of estimating the available food in both a soil and a manure—a statement that still further proves the unsatisfactory character of our knowledge of the relation of manures to soils.

One inference to be drawn from the paper under review is that an alkaline phosphatic manure is under ordinary circumstances the most economic, for while superphosphate is suited only to soils which contain plenty of lime, basic slag is best restricted to soils which are particularly sour.

The question will be asked, what is alkaline or basic superphosphate? This is the new manure which Mr. Hughes may be said to have "discovered." The following extract from his paper will give our readers a fair idea of the fertilizer:—

It occurred, to the author, after careful consideration in the autumn of 1900, that a new and useful manure could be produced by the careful admixture in suitable proportions of ordinary acid superphosphate with finely ground or slaked lime.

After making numerous trial mixture the most suitable proportions were decided upon, and a manure was produced which possessed a distinctly alkaline or basic character, and at the same time supplied from 25 to 27 per cent of phosphate of lime in a form readily soluble in the standard solution (1 in 1,000) of citric acid.

The manure so produced was appropriately called basic superphosphate, because it combined the alkaline nature of slag with the well-known solubility of superphosphate.

The mechanical condition is superior both to that of basic slag and superphosphate. Compared with the former it is much more bulky and lighter in weight, so that if equal weights be placed in two glass tubes about 1 foot long, basic superphosphate will be found to occupy a space of 11 inches as compared with only 4½ inches occupied by basic slag, the relation in round numbers being as 100 to 40.

Compared with superphosphate the new material is very much drier, containing only 4 to 5 per cent of moisture instead of the 14 to 18 per cent usually found in commercial superphosphate.

Being in a finely ground dry powder of light weight and bulky nature, greater uniformity and more perfect distribution can be obtained than is possible with basic slag, which when sown by hand is apt to drop between the fingers before complete delivery can be effected.

The general composition of basic superphosphat may be gathered from the following analysis:—

COMPOSITION OF BASIC SUPERPHOSPHATE.

Moisture (lost at 212° F.)	4·15
Combined water and loss on ignition	12·86
*Phosphoric acid (total)	13·60
Lime	35·15
Sulphuric acid	28·50
Oxides of iron, alumina, magnesia, &c.	2·34
Insoluble siliceous matters	3·40
Total ..	100·00
*Equal to phosphate of lime	29·68

The manure usually contains from 33 to 35 per cent of total lime, so that in this respect basic superphosphate supplies fully 10 per cent more lime than ordinary acid superphosphate.

Basic superphosphate can be applied, indeed has been applied in the season of 1901, with great advantage on soils deficient in lime, such as sand, gravel, granite, peat and clay.

Briefly, it may be stated that all soils containing less than one per cent of lime will be greatly benefitted by the application of basic superphosphate instead of slag or ordinary superphosphate.

It is of practical importance to state that, though originally invented to supplement the deficient solubility of slag, which is fully recognised by those interested in its sale (they therefore recommend its application during the winter months), it has been found by actual field results that the new manure is superior also to superphosphate on soils deficient in lime.

For a further account of the new manure and results of trials made with it we must refer our readers to Mr. Hughes' paper. There is no doubt that a useful fertilizer has been brought to light, and that through it the problem of how to secure the most economic results in the use of phosphates has in a measure been solved. It has been long recognised that the action of these manures is to a great extent dependent on and controlled by the presence and proportion of lime in the soil. But lime, as we know, is very liable to leave the surface soil, and as Mr. Hughes points out it would be far more expensive to supply sufficient lime to a soil that lacks lime so that every square inch should contain enough of it to neutralise any acid brought in contact with it. The adding of about 20 per cent of lime to the superphosphate, sufficient to neutralise all the acid and produce slight excess in order to give it a distinctly acid character, does everything that is required to be done.

THE CULTIVATION OF THE GROUND NUT.

The pea, earth, or ground nut (*Arachis Hypogœa*) is an annual of the leguminous order, or pea tribe of plants. Before it blooms it generally assumes an upright habit, usually attaining a height of about one foot; but when the flowers appear the plant falls over, and makes its subsequent growth in a procumbent position. The leaves are abruptly pinnate, bearing two pairs of leaflets without any tendril; stipules elongated and adnate to the leaf-stalks.

The flowers are yellow, and are arranged five to seven together in the axils of the leaves. These are succeeded by pods about 1½ inches long, and contain two, and sometimes three, seeds, seventy-five of which weigh 1 oz. The most remarkable feature of the plant is that it thrusts its fruit into the ground to effect its maturation. This peculiarity, however, is not confined to this genus of plants, but exists likewise in an allied genus (*Voandzeia subterranea,* Thours.), commonly known as the Bombara ground-nut. This plant is a native of Madagascar and various parts of Africa, and has been grown successfully in this country, but it will be more fully noticed in a seperate article.

The pea-nut is a native of the West Indies and West Africa, but it is now cultivated extensively in many of the warmer parts of the earth for the sake of its seeds. There are two well-marked varieties of the plant, the difference between them being that one has a small pod and the other a large one. Its cultivation is withal so simple, and as it only occupies the land for about five months of the year, the produce can soon be turned to profitable account. Taking into consideration the quantity of pea-nuts that are consumed in the Colony, it would take the produce of many acres to supply the annual demands. The chief commercial value of this plant, however, is the valuable oil that can be expressed from its seeds.

Professor Church, (to whom we are also indebted for the engraving of the plant), gives the following analysis of the Pea-nuts:—

Composition of Pea-nuts.

	In 100 parts.	In 1 lb.
Water	7·5	1 oz. 87 grs.
Albuminoids	24·5	3 „ 403 „
Starch	11·7	1 „ 382 „
Oil	50·0	8 „ 0 „
Fibre	4·5	0 „ 315 „
Ash	1·8	0 „ 126 „

It will be seen by the foregoing analysis that the pea-nuts contain 50 per cent. of their weight in oil. This excellent result must not be expected, however, as a general thing, for the yield varies in nuts that are grown on different soils, and it will be safe to put it down at a lower figure. The oil is thin, of a clear, pale, straw colour, somewhat resembling poppy and the finer kinds of olive oils. It will not become rancid, and it is said to be improved with age. In commerce it is known as "nut oil," and it is said, on good authority that olive oil is not only adulterated with it, but that this nut-oil is "often substituted for it." It is a valuable oil as a lubricant for delicate machinery, and as it does not clog the bearings, it possesses great advantages over many other kinds of oil. The oil is extracted from the pea-nuts by two processes—one of them by simple pressure, and the other by the application of heat. Whilst a greater percentage of oil can be obtained by the application of heat, that obtained by the simple pressure process is more valuable as a commercial article. After the greater part of the oil has been extracted from the pea-nuts by pressure, the residue, or cake, can be used for feeding cattle, and it is considered very fattening. Moreover, it can be used as a fertiliser for sugar-cane lands, and also for other crops that are exhaustive to the soil, Besides the valuable products already mentioned, the pea-nut has many other important economic uses. Owing to the fact, however, that the nuts contain such a large percentage of oil in a fresh state, they require a considerable admixture of starchy food in order to render them easy of digestion, Enormous quantities of parched pea-nuts, however, are consumed nearly all over the world, more particularly in America, and they are far from being unknown in this country, for boys may often be seen eating them, although they are sometimes inferior to what they would be if grown and parched in the Colony. I read a short time ago where one American writer of authority stated that the manufacture of chocolate cakes out of pea-nuts alone, and without a particle of cocoa, is an immense and profitable manufacture in the States. Although so much has been said about this valuable economic plant, its uses are not nearly exhausted. As a green crop it makes valuable forage, and after the pea-nuts are picked off the dried stems, the latter make valuable fodder, which herbivora of all kinds are remarkably fond of, and they are said to be very fattening.

The soil best suited to the growth of the pea-nut.—The soil best suited to the growth of this plant is of a light sandy nature, or one inclined that way. It is important that the surface soil should be loose, so that the young pods have no difficulty in pushing their way into the ground to effect maturation. After a suitable piece of ground has been chosen it should be thoroughly cleaned of all weeds and rubbish, and ploughed with a light one-horse plough to a depth not exceeding 6 inches. If it is not naturally fertile, some manure should be applied. If well rotted farm-yard manure is not available, then those commercial manures should be applied that are rich in phosphates. Superphosphate of lime is considered an excellent manure to apply to the land where this crop is grown. The advantage of shallow cultivation will be apparent when it is explained that after the embryo nuts are fertilised, the stalks they are attached to will continue to push themselves into the ground until a firm bed is reached for the peanuts to mature on. When the pea-nuts are matured as near to the surface of the soil as is practicable, the harvest operations are not nearly so laborious, because the produce is more easy to bring to the surface, and a less number of nuts will be likely to be left in the ground. If the soil can be left in a rough ploughed condition for a month or so previous to planting, so much the better—the sun and air will get into it and sweeten it. If weeds should spring up, however, the scarifier should be put over the land to kill them. The scarifier should be freely used on the land a few days previous to planting, so that it will be in the best possible tilth to receive the seed, and be cleaned thoroughly free from weeds.

The rows should be 3 feet apart, and the seeds sown 18 inches apart in the rows. This will allow the land to be easily worked with a horse and light plough or scarifier. It will take 25 lb. of seed to plant an acre. Like many other kinds of seed that contain a large percentage of oil, the pea-nut soon loses its germinating power, even when kept under the best of circumstances. The first

requisite for a good crop of pea-nuts is good seed. In countries where the crop is grown on commercial lines the selection of seed is a most important matter. They are all carefully shelled and hand-picked, and only the plump, perfect ones with unbroken skins, being kept for sowing. If this matter is not carefully atteuded to, there will be a great many blank places in the field. A few years ago pea-nuts were planted by hand, but it was a very tedious and laborious process. Of late years, however, a simple but effective mechanical contrivance has been brought into use, which deposits pea-nuts at regular distances in the rows and covers them carefully over. With the aid of one of these machines a man can plant about 7 acres per day. It is advisable to sow a few extra seeds in some portion of the field to provide plants for any blanks that may occur. It will also be necessary to keep a close watch on the field until the seedlings are well above ground, for mauy birds and small animals are so fond of pea-nuts that if the fields are unprotected there would be many blanks to fill up. The young plants will begin to appear above ground in about ten days or a fortnight, according to the state of the weather. When the plants have appeared above ground they are a very pretty sight, and look very much like a lot of young red clover plants, as we see them in spring time in the old country.

When the crop shows signs of ripening, the pods will turn brown. As soon as they have arrived at that stage they must be lifted, or they will get discoloured. If this should take place, their value as a commercial article wil be depreciated. If only a few rods of ground are under cultivation, the pea-nuts may be lifted with a fork, but where there are several acres the operation is best done with a plough. This should be run under each row, which will sever the main root of the plaut, and will leave the plants and pods on the surface. After they have laid on the ground and become partly dried, they should be stacked in the field to complete the operation. This is usually done in the following way:—Select some stout stakes, about 8 feet high, sharpen one end, and drive them into the ground about 18 inches. See that they are left in a perfectly upright position, at right angles. Nail cross pieces of wood, about 3 feet long, beginning at 2 feet from the bottom and continuing at every 2 feet until the top of the stake is reached. With a fork gather up the plants, and put as many on each stake as it will comfortably hold, If showery weather should ensue before the pea-nuts are sufficiently dry it will be advisable to put a cap of hay or straw on each stake to throw the rain off. After they have become sufficiently dry, the pods may either be picked off in the field or the stacks stored in a barn for the pods to be picked off at some future time. The picking is the most tedious process of all, for it has to be done with hand labour. If an efficient but simple machine could be invented to strip off the pods without injuring them it would not only ;faciliate getting the produce to market, but it would prove of inestimable value to farmers in sparsely-populated districts, where it is often a difficulty to get labour of any kind to perform what work there is to be done.

As many as 115 bushels of pea-nuts have been harvested from an acre. This, however, is an exceptional case, and the average yield must be put down at a much lower figure. About 25 or 30 bushels are considered a fair crop.—*Agricultural Gazette of N. S. Wales.*

SHADE FOR YOUNG TREES.

To the Editor of the "Agricultural Magazine."

DEAR SIR,—In a state of nature young trees grow for a considerable time under shade, and this fact would lead one to ask the question whether shade might not be advisedly supplied to cultivated trees such as the coconut during the early stages of growth—shade for roots as well as foliage. This might be considered rather a fantastic idea by many, but it may be worth lookiug into.

In the young stage the parts of the tree—stem, leaves and roots—are in a more or less immature and tender condition, at least they have not become "hardened" with increased vigour to the extent that trees of some age have done. Under such circumstances some means of protection against the effects of extreme or varying temperatures may be admitted to be likely to act beneficially. Some fast growing tree of the leguminous order (as likely to add fertilty to the soil) such as the Erythrinas would naturally be thought of in this conuection, if remunerative catch-crops (such as cassava in Ceylon or plantain—the favourite shade tree of the West Indies) are to be discarded as likely to impoverish the soil and as providing iusufficiently high and yet broken shade.

In very dry situations shade during the early years of growth, as preserving the soil moisture and protecting the foliage, would enable the plants to make an earlier start and more rapid growth than if no shade were provided.

I have heard of a case where coconuts failed to grow till the lantana scrub was provided, when they came up and flourished into a valuable plantation.

Bare land exposed to a fierce tropical sun is hardly the best condition of soil for young growing plants. Just now much attention is being paid to mulching which is highly recommended by competent authorities in coffee cultivation. In the case of the cocouut it is only reasonable to expect some protection for the soil and the roots that in the early stages have not penetrated to any extent into the lower moisture-holding strata.

Weeds, small and great, are generally looked upon as robbers of the soil, but that can only be when they are allowed to flourish and are then pulled up and conveyed off the land. In the case of short-lived delicate plants such as are grown in market gardens the utilization of weeds to any advantage is impracticable, but this is not the case in the permanent cultivation of large trees. Here weeds cannot retard the growth of the crop to an appreciable extent—if at all—while there would be no loss (rather gain) of fertility, provided that they were not carried off the land. The only

requisite would be to keep the weeds within reasonable bounds.

I have seen young trees parched and struggling on a dry soil during the hot weather, while others of the same age were green and flourishing amid lantana scrub. This was in the Chilaw district.

I have also seen full-grown trees looking decidedly cool and comfortable with a dense undergrowth of leguminous weeds in the Kurunegala district.

I should like to have the views of experienced planters on these points:—(1) Whether they approve of keeping young coconut palms for a few years amid low jungles but protected from over-crowding by creepers, &c., in order to provide shade and conserve the soil moisture, or whether they would recommend planting leguminous shade trees (Erythrina) to be gradually removed later on. (2) Whether they approve of keeping an undergrowth of weeds (preferably leguminous) in old plantations. If not, what objections they have in the carrying out of these suggestions.

Yours truly,
C. P.

[Here are a few interesting points for some of our subscribers (and among them are many experienced coconut planters) to attack during a leisure hour.

Clean cultivation our correspondent is no doubt ready to admit is a *sina qua non* under certain circumstances, but he evidently desires to have the views of experienced hands on the departure he proposes in the special case of coconuts and other large trees. A gentleman who possesses a large plantation of mangosteens whispered it to us as a secret that it is kindness (in the shape of too much attention) that kills the young mangosteeu: and he showed us some hardy plants which looked double their age, flourishing as he said "in the jungle." Those thinking over the question of growing under shade will be interested in the first article in the May *Tropical Agriculturist*, where an account of the successful cultivation of pine-apples under shade is given.—ED. *A.M.*]

THE ENTOMOLOGY OF THE HOUSE FLY.

(*Continued.*)

Many of the habits of the fly are painfully familiar to all of us. Its discordant buzzing, its exasperating persistency in returning again and again to our sensitive bald spots, setting our nerves on edge with the tickling of its feet and the rasping of its proboscis and its headlong floundering into the milk jug and coffee cup; likewise its habit, so distressing to the careful housewife, of marking its path, especially on newly-polished mirrors, with little dots of brown-black excrement, are well known to almost everybody. If the fly was a cleanly insect, the importance of these associations with man and man's belongings would be limited by the temporary annoyance caused. But the house fly is far from cleanly. It breeds in dung and returns to dung to lay its eggs, it flits direct from suppurating sores on the skin of animals to regale itself on our perspiration; it visits stercus, and then, perhaps, the milk pail.

Numerous diseases, some of them most serious in character, may result from the visits of the fly to our food and our persons, for it oft brings with it virulent germs from the fæcal or putrid matter which it has visited. It has been demonstrated that the fly can contract plague from feeding on animals that have died of this disease, and that, having contracted plague, it may live for several days and finally fall or drop dead on to food, meanwhile having been depositing excrement laden with virulent bacilli. It is firmly believed by medical men in India that cholera is very frequently transmitted by the house fly. Tuberculosis bacilli are taken up by it through feeding, as it often deos, on the sputum of consumptive persons, and these germs are given off in the excreta. The excreta of flies that had been fed on infective sputum, when injected into rabbits, has given rise to tuberculosis. But of all diseases that it may transmit, typhoid or enteric fever probably ranks first in importance. The dejections of persons infected with this disease, it has been stated on the best of authority, harbour the causal organism not only during the period of actual illness, but for some days before and for some time after apparently complete recovery. The fly becomes contaminated by alighting on dejections that have not been properly disinfected, and then may carry the germs into surrounding households. The bacilli multiply rapidly in milk, and how easily can a fly render a whole pailful poisonous by falling into it or even simply sipping it! In cities and towns with good sewerage systems and well-enforced sanitary regulations, the carriage of typhoid by the fly is doubtless exceptional, but in concentration and army camps it is presumed to be very common.

Not only may the fly convey infectious diseases, but, it is asserted, some of the worm parasites that afflict humanity as well. The eggs of the tape worm and of the tiny thread or pin worm were found to pass unaltered through "flies" (presumably house flies) by an Italian investigator; and an American zoologist found that fly maggots (of genus *Musca*, species not stated) will devour the common round worm, and that the eggs of the worm are passed off alive in the excreta of the winged adults. The excreta may be dropped on the food and the contained eggs carried into the intestines, where they can develope. It is probable that the life circle of the worm normally depends npon such an extraordinary sequence of happenings for its completion, but as the eggs are almost numberless the survival of the species can safely rest on very slim chances of one egg, or indeed of any one egg if a thousand becoming lodged in the intestine.

The fly evil can be abated to some extent by preventives against multiplication. The thorough cleansing of stable floors even once a week, and the keeping of manure in pits from which flies cannot escape or spreading it on the land where it will dry out quickly are practical measures of high

value to which effect may be given. The maggots swarm in floor crevices and in corners of stalls where dung collects, and thence the necessity of thoroughly cleansing the floor.

To minimise disease transmission human excrement should never be left exposed, and indeed should be at once disinfected. Where sanitary measures are in force covers should be provided for buckets.

Small mesh nettings at the windows and doors are little seen, though in America dwellings are thus protected. Incidentally the screens afford relief from mosquitoes and lessen the dust. The nettings (generally coloured) admit air freely but break the light, so that though a person within can see out clearly one without can see in only dimly.

The value of sticky fly papers, the best of which is that styled "Tanglefoot," of sticky fly strings, of poisoned fly paper, and of wire fly traps are well understood by most housekeepers. All these devices for reducing the number of flies have their disadvantages, yet with due regard to circumstances they are all highly commendable. Sticky fly paper is the least objectionable, despite the buzzing of the victims and the risk of catching one's clothing. Poisoned paper is somewhat dangerous where inquistive children and pets are about, and besides, it is rather disagreeable to have dead flies dropping into everything. The art of driving flies out of a room seems almost unknown by the majority of Colonials, but driving them out is one of the best ways of getting rid of them. The room to be cleared is darkened except at one partially opened door or window, and the flies are "shooed" with a whisk or cloth to this exit; they move readily towards the light when disturbed, but some skill and patience is required to get them all to leave. Even without more trouble than simply darkening the room and leaving a lighted exit, many of the flies within will pass out; it is a good practice to thus treat dining-rooms between meals.

Pyrethrum powder, otherwise known as insect powder, Persian powder, Dalmatian powder, and most familiarly as Keating's powder, is excellent for use against flies. Some people like to blow an ounce or two with a powder bellows into the closed room at night, others to burn a little on coals or in a roll of twisted paper, but the first method involves a layer of dust and the second a peculiar odour that remains for days, while both necessitate the sweeping up of the stupified victims in the early morning. The neatest way to use it, I think, is to dust it liberally on the window ledges and sills, the windows being closed. When the other sources of light are shut off the flies sooner or later seek the windows and one by one are overcome by the volatile oil of the powder and drop senseless. In the writer's house, the fly is kept almost completely suppressed by darkening the rooms on the days that flies most commonly seek to enter, dull days when rain threatens, by keeping food under cover as much as possible, and by keeping the dining-room, kitchen and pantry dark at all times when not in use, together with the exertions of madam with her butterfly net. Thanks to these measures, it is seldom that a dozen flies can be found in the whole house even in the height of fly season and when the dwellings of neighbours swarm with the nasty pest. Catching the fly with a butterfly net may seem a childish measure, but it is really a quick way of clearing a room by one who knows how and has a wide deep net.

There is a section of the public of late years who believe that every insect has sufficient natural enemies to hold it in close check, and that insects are only pests through reason of having been separated from one or more of these enemies. I should like to hear one of these people apply his theory to the house fly. It is an insect that seems to be known throughout the world and to pester man everywhere. Natural enemies it has to be sure, but who thinks of these in connection with its abundance? Aside from climatic conditions, the factor of overwhelming importance governing its numbers is not parasites or predaceous enemies, but the question of food suply. Furnish it with an abundance of suitable manure to breed in, and its natural enemies, as far as I can see, have no appreciable effect on it. I greatly fear it is the food supply factor and not the absence of the "proper enemy" that accounts for the pestiferousness of many insects that attack farm and orchard crops. The house fly is preyed on by various small animals as toads and some lizards, and every child knows how some spiders ensnare them. A certain species of long-legged centipede, *Scutigera forceps*, an uncanny creature one sometimes sees scurrying over the walls at midnight, is credited with being an enemy of some importance. So is a tiny red mite, like a small tick, that infests the body of the fly Then hymenopterous parasites and predaceous beetles are recorded to destroy the maggots; and, lastly, a fungus disease accounts for many of the adults. Specimens which have succumbed to the disease are often to be seen adhering to window glass, surrounded by a halo of white fungus filaments. All over the world the house enemies of the fly seem k be the same.

The remarks here made apply to our species of house fly (*Musa domestica*), but half-a-dozen kinds of flies have the habit of intruding themselves into dwellings. In general what has been said as to remedies applies equally to the others. Most of them, like the house fly, are creatures of filth, but as they are far less abundant indoors they are correspondingly less dangerous to health. Dr. Howard recently had collections of flies caught for him in dining-rooms and kitchens in different parts of the United States, and of the 2,300 specimens he received, 98 % proved to be the true house fly. Next to the house fly a species called the stable fly (*Stomoxys Calcitrans*) is reported to be most abundant in houses in the United States. This fly would be mistaken for the house fly by ninety-nine people out of a hundred, but it is distinct and has a hard-pointed proboscis for piercing the skin instead of the broad-tipped, fleshy retractile one.

In closing, let me urge you to always remember that everywhere the common house fly is a creature of foul and filthy habits and one liable to bring misery, disease and even death to your household. Therefore, spare not a little trouble to make its existence a hard one on your premises.—*Cape Agricultural Journal.*

PLANT LIFE.

[A SERIES OF SIMPLE LECTURES INTENDED FOR A CLASS OF JUNIOR STUDENTS.]

LECTURE V.

Let us now enquire what plants take up from the soil by way of food. To begin with, we must recognise that the food of plants as taken up from the soil consist of more or less soluble compounds spoken of as salts. There are compounds produced by the action of an acid (such as nitric acid) upon a base (such as potash). In this way we get salts such as nitrate of potash, or as it is better known "Saltpetre." This last mentioned salt is one of a class of similar compounds (salts) which, as I have already stated, form the food of plants. Some of these salts though present as a rule only to a small extent are essential to the life of the plant; others which are generally met within the soil are not indispensable though useful to plants. Those which are essential are the salts of potash, magnesia, lime, iron, and in addition phosphorus and sulphur. These which are useful though not indispensable are the salts of soda, silica, manganese, together with chlorine and occasionally other ingredients. What salts these substances form will of course depend upon the acid with which it combines, whether nitric acid, sulphuric acid, or any other acid. Thus we will get nitrates, sulphates, and so on. To attempt a fuller explanation of this part of the subject will be going too much into chemistry, which at present we must avoid. What I have told you will, I think, suffice to make you understand the nature of the food taken by plants from the soil. The most important of the salts referred to above are the nitrates, because they supply what we may say is more important than any other of the elements of plant food, viz., nitrogen. If you ask why certain elements are essential as plant food, I can only say that it has been proved by actual experiment that plants will not grow and flourish without them. The exact place which they fill in the plant economy is difficult to make out, though some scientific men appear to have found that they are required for certain ends. For instance, nitrogen, we are told is an essential constituent of protoplasm (that is the *living* part of plants), and since without nitrogen there can be no protoplasm, without protoplasm there can be no plant. Potash is said to be necessary for the full assimilation of the carbon, which, we have seen, is derived from the air in the form of carbonic acid gas. Recent experiments also tend to shew that without potash no starch can be formed, and starch, you should know, is of primary importance in the nutrition of plants.

Both sulphur and phosphorus are found associated with protoplasm. Phosphorus is believed to be needful in the formation of the pollen or fertilizing powder in the flower, and in the ripening of seeds.

Iron is essential to the formation of leaf-green or chlorophyll, which is essential to the production of starch.

Though the precise function of lime is not known, it is of the greatest importance at least in keeping up the supply of the other essential ingredients. The substances already mentioned and others not alluded to, though not directly concerned in nutrition, yet are so indirectly, by causing changes in the soil, by rendering some matters soluble and capable of absorption by the plant, by storing up and preventing the waste of ingredients useful as plant food, and so on. But we are again going rather outside the scope of our subject.

Plants are known to take their food in certain proportions, and cannot be induced to favour a particular substance, because it is supplied or is present in the soil in large quantity. This would seem to indicate the existence of a power of selection as regards food, but is explainable by the varying absorptive capacity of plants; so that by virtue of such varying absorptive and digestive powers, plants take what they want and when they want it, and are not induced to take more by additional supplies.

GENERAL ITEMS.

According to the *Jamaica Agricultural Society's Journal* there is no difference whatever between the two pines known as smooth Cayenne and Giant Kew. A variety, apparently a new one, as being unknown in Jamaica, that should be worth cultivating is the "white Guatemala spineless," thus described by Mr. J. C. Harvey who says that it was introduced into Mexico from Guatemala. It is absolutely smooth and has much the appearance of smooth Cayenne, that is to say the plant. The latter has a few short spines at the end of every leaf and the flesh is yellow; this new pine has absolutely no spines whatever and the flesh is almost snow white—sweet but with a slightly sub-acid yet not stinging taste. The fruit is smooth and not conical—in fact perfect in form—and reaches with practically no cultivation 7 lbs. The core is never woody, and as it keeps well should prove a good market pine. The plant seems to be particularly adapted to heavy soils and damp situations.

In some of the largest and most successful pine apple plantations in Florida, the soil is almost a pure sand containing as much as 99 % silica. It is said to be a mystery how pines grow in such a soil and yet they do grow. At the School of Agriculture, where the soil is particularly sandy, the pine apples have been doing very well, and all through May bore a good crop of fruit.

The Paris Exhibition, where Ceylon made such a good show, has for one thing benefitted the tea industry in the Island, for the custom of "five o'clock *Ceylon* tea" appears to be spreading in the French capital. It is to be hoped that advantage will be taken of the St. Louis Worlds' Fair to make a thorough representation of our products with a view to educating the great American nation to an appreciation of what is "made in Ceylon."

Says the *Agricultural Journal and Mining Record:*—"The object of an Agricultural Show is the thoroughly practical one of improving agriculture and live-stock of the country. It would be a regretable circumstance if this fact were ever to be overlooked in the slightest degree."

There are still among practical foresters those who do not admit that the destruction of forests diminishes the rainfall. Two instances lately brought up are the cases of Tripoli, once a fertile country now desolate owing to the destruction of the forests which resulted in the disappearance of water, and of the forests of La Trappe by the denudation of which the springs and the ponds fed by them dried up.

Some interesting specimens of grafting showed before the Prussian Horticultural Society proved that the graft had exercised a more or less marked influence on the stock—an effect the opposite of what is usual.

ROYAL BOTANIC GARDENS.

EXTRACTS FROM THE REPORT OF THE DIRECTOR FOR 1901.

1.—General.

THE organization of the Department upon modern lines has continued, and is becoming fairly mplete in the case of two of the three main subdivisions which are proposed, the Scientific and the otanic and Horticultural Gardens Divisions. The third, or Division of Experimental Gardens, is as t only under consideration, but it is hoped that it may soon be organized. The Scientific Division, hich includes the Director, Mycologist, Entomologist, Chemist, and Assistant, is charged with the ientific investigation of the flora of Ceylon, both indigenous and introduced, with special reference to e economic uses of the plants and the diseases that attack them. The work of this division includes e upkeep and working of the laboratories, library, herbarium, and museum, tours in the Island for the udy of plants, cultivations, and diseases, the giving of advice and assistance in all such matters to ficials and cultivators, personally and by letter, and, most important of all, the continual carrying on researches upon the physiology and pathology of plants, their structure, distribution, and other bjects. Successful practical applications of science must be based upon thorough scientific investi- tions ; such work is laborious and needs long periods of time, and it is of the greatest importance that e scientific officers should have the greater portion of their time at their disposal for such work. he appointments of the Entomologist and Mycologist in particular have met with much appreciation, d their help is so constantly sought that a very great part of their time is taken up with personal sits, interviews, and correspondence. In the past year a great amount of work has been carried out y these officers, whose reports are given below, and the result of their work is becoming clearly parent in the greater freedom from disease of many districts and estates. The Colony has on the hole been free from any very serious epidemics of disease during the year, and the agricultural public s become much more alive to the advantage of keeping a sharp look out for the first appearance of sease and of immediate treatment thereof.

The Director and Chemist have completed an investigation into camphor and have published sults, showing a fair possibility of this product proving remunerative as a cultivation in Ceylon. It already being tried on several estates, and if it prove successful will add another to the few minor oducts that are as yet cultivated in the tea districts. Investigations of citronella oil, indiarubber, and ier products have been continued. The good results of similar work in past years are now becoming parent in the increasing export of, and the high prices obtained for, indiarubber and coca, both ginally introduced by this Department, and which may now be looked upon as new minor industries Ceylon.

The Assistant has continued his researches into the mode of formation of ebony, calamander, l similar timbers, and into the important problem of the formation of rings in tropical timbers. H has also explored the guttapercha-yielding districts of the south-west, and investigated our local ta-producing trees. Some of these have been found to yield a gutta in fair quantity by simple ping, without its being necessary to sacrifice the tree. The gutta is not of good quality, but it is not robable that it may prove commercially valuable.

The Director has completed the investigation of the flora of the Maldive Islands, including the ivated plants. The results have been published in the new scientific journal, the "Annals of the

EXTRACTS FROM THE REPORT OF THE DIRECTOR FOR 1901.

1.—General.

The organization of the Department upon modern lines has continued, and is becoming fairly complete in the case of two of the three main subdivisions which are proposed, the Scientific and the Botanic and Horticultural Gardens Divisions. The third, or Division of Experimental Gardens, is as yet only under consideration, but it is hoped that it may soon be organized. The Scientific Division, which includes the Director, Mycologist, Entomologist, Chemist, and Assistant, is charged with the scientific investigation of the flora of Ceylon, both indigenous and introduced, with special reference to the economic uses of the plants and the diseases that attack them. The work of this division includes the upkeep and working of the laboratories, library, herbarium, and museum, tours in the Island for the study of plants, cultivations, and diseases, the giving of advice and assistance in all such matters to officials and cultivators, personally and by letter, and, most important of all, the continual carrying on of researches upon the physiology and pathology of plants, their structure, distribution, and other subjects. Successful practical applications of science must be based upon thorough scientific investigations; such work is laborious and needs long periods of time, and it is of the greatest importance that the scientific officers should have the greater portion of their time at their disposal for such work. The appointments of the Entomologist and Mycologist in particular have met with much appreciation, and their help is so constantly sought that a very great part of their time is taken up with personal visits, interviews, and correspondence. In the past year a great amount of work has been carried out by these officers, whose reports are given below, and the result of their work is becoming clearly apparent in the greater freedom from disease of many districts and estates. The Colony has on the whole been free from any very serious epidemics of disease during the year, and the agricultural public has become much more alive to the advantage of keeping a sharp look out for the first appearance of disease and of immediate treatment thereof.

The Director and Chemist have completed an investigation into camphor and have published results, showing a fair possibility of this product proving remunerative as a cultivation in Ceylon. It is already being tried on several estates, and if it prove successful will add another to the few minor products that are as yet cultivated in the tea districts. Investigations of citronella oil, indiarubber, and other products have been continued. The good results of similar work in past years are now becoming apparent in the increasing export of, and the high prices obtained for, indiarubber and coca, both originally introduced by this Department, and which may now be looked upon as new minor industries in Ceylon.

The Assistant has continued his researches into the mode of formation of ebony, calamander, and similar timbers, and into the important problem of the formation of rings in tropical timbers. He has also explored the guttapercha-yielding districts of the south-west, and investigated our local gutta-producing trees. Some of these have been found to yield a gutta in fair quantity by simple tapping, without its being necessary to sacrifice the tree. The gutta is not of good quality, but it is not improbable that it may prove commercially valuable.

The Director has completed the investigation of the flora of the Maldive Islands, including the cultivated plants. The results have been published in the new scientific journal, the "Annals of the

Royal Botanic Gardens, Peradeniya," of which two numbers have been issued during the year, containing several papers by members of the staff and one by a visitor, who worked for some time in the Peradeniya laboratory. Several scientific workers from abroad have used the laboratories and other facilities now available here, which are becoming widely known. A small branch laboratory has been constructed at Hakgala, with sleeping and living accommodation attached to it, thus rendering that garden of much greater value than hitherto.

Several numbers of the "Circular" have been published during the year, and appear to have met with much appreciation. The circulation of this little periodical continues to increase; it is sent to local subscribers at the lowest possible rate, merely sufficient being charged to cover postage (50 cents for twenty numbers). The articles in this journal are popularly written, and do not overlap those in the "Annals."

In view of the extension of the work of the Department, and the increasing interest manifested in "new" products and in scientific methods of cultivation and preparation of economic products, a re-organization of the Economic Museum at Peradeniya has been commenced, and at the same time an attempt is being made to collect and classify all available information about the existing or possible economic products of Ceylon; the great masses of letters, cuttings, notes, references to books, &c., which have accumulated at Peradeniya during the past century are being arranged in files of a somewhat new design, which will be kept in a public consulting room at the museum, and the specimens in the museum are being renewed and re-arranged in accordance with the files, so that inquirers may be able to obtain all available information about products in which they are interested with the least possible trouble to themselves and to the staff of the Department. At the same time a *résumé* of the chief facts of importance about all known economic products of the Island, native, cultivated, or imported, is being put together in book form, and is now in course of publication in the form of supplements to the "Annals." It is hoped that in this way a reliable work of reference may be completed within two or three years, which may prove valuable to planters, officials, and others interested in the products of the Island. The first chapter, dealing with gums, resins, indiarubber, &c., is now almost completed, and part of it has already appeared in print with the second number of the "Annals." The local annual subscription of Rs. 2·50 also covers the supplements.

The second division of the Department (Botanical and Horticultural Gardens) includes the five gardens in different parts of the Island, and it has lately been decided by Government to open a sixth very small garden in the new park at Nuwara Eliya, with the view of trying what can be done on the peculiar soil of that place. The main duty of this division is to introduce and cultivate a few specimens of every possible kind of plant that may prove of use or interest, and to provide beautiful gardens for the pleasure and instruction of the public. At the same time it provides instruction and advice on horticultural matters, and supplies seeds and plants to the public in small quantity. It is no part of the duty of a botanic garden to make large scale trials of economic plants or to supply large quantities of seeds or plants. This is the work of an experimental garden, and hitherto such an institution has been wanting in Ceylon, but negotiations have been in progress during 1901 with the object of providing such a garden, where experiments may be tried on a commercial scale with staples or with plants which may become staples. Such experiments may include not merely the cultivation of considerable areas of one plant, but the trial of manures, different modes of cultivation and treatment for disease, modes of preparation of products for market, and their actual sale upon the open market. Such an institution may serve as an object lesson, and supply when necessary large quantities of seeds or plants, besides testing the commercial possibilities of different cultivations. It may also undertake the very desirable work of breeding new and improved races and varieties of cultivated plants.

Office work continues to increase, and the correspondence with planters and others is becoming very heavy. Working rooms have been provided for the Entomologist and Mycologist by the alterations of the godowns under the library suggested in last report. The library has been largely added to by purchase, gift, and exchange, and is steadily becoming a really good working collection.

An Ordinance (No. 5 of 1901) has been passed enabling the Government to take any necessary steps, such as fumigation, quarantine, or exclusion, to prevent the introduction of disease into the Island with plants from abroad. The import of cacao plants from the Dutch Indies has already been prohibited under this law.

A system of small gardens at village schools having been inaugurated by the Department of Public Instruction, this Department has supplied large quantities of seeds and plants of the best useful kinds for distribution to the schools. Good results in the introduction of new cultivations and increased interest in agricultural progress may be hoped for from this work.

The total cost of the Department, including special votes, has been Rs. 72,087, against Rs. 71,740 last year. The receipts from sales, though the number of purchasers has increased, show a fall from Rs. 4,658 to Rs. 3,741, owing to the cessation of the demand for rubber seed.

2.—Notes on Economic Products, &c.

Hitherto the notes given annually under this head have been somewhat irregularly arranged, the more important products being treated first. Commencing with the present year the various products will be dealt with according to the different classes to which they belong, following the scheme of classification adopted in the Handbook of Economic Products of Ceylon now in course of issue.

Class I: Gums, Resins, Caoutchoucs, Guttas, &c.—An investigation into the gums and resins produced by the wild plants of Ceylon has been started, with the view of finding out which are of value for local use as substitutes for imported articles. It seems improbable that any of our local products of this kind are good enough or cheap enough for export.

Indiarubber may now be regarded as established as a minor product in the low-country, and an export of appreciable quantities of Hevea or Para rubber has begun; 66 cwt., valued at Rs. 11,986, were exported in 1901 to England. Being carefully prepared, this rubber is of excellent quality, and has sold for prices much exceeding those of the best Para rubber sold on the same market from wild sources. On one occasion 4*s.* 1½*d.* per lb. was received for "good biscuit," against 3*s.* 9½*d.* for "best Para." A recent market report says: "Ceylon sells with eager competition. The rubber is much liked, and in large quantities would bring high prices." Extension of planting continues in suitable districts, and probably 3,000 acres are now in rubber. In most cases the rubber is mixed with tea and planted by roads and ravines, and perhaps this is for most estates the most satisfactory method of planting under present circumstances.

There has been no demand for, or planting of, guttapercha during the year. At the instance of the Forest Department Mr. Wright was deputed to explore the forests of the low-country of the south-west and test the gutta-yielding trees there found. His report below gives a brief statement of work done, and full details will be published after receipt of analyses and valuations.

Camphor has been a good deal planted during the year, the chief check being the difficulty of getting good seed, there being no local supply as yet. A Circular has been issued by the Department showing, as the result of some years' experiments, that the tree can be successfully cultivated in many parts of the Island, and that the twigs and leaves yield about 1 per cent. of camphor by a simple process of distillation, a yield which offers a prospect of proving remunerative. The great risk attending this cultivation is that the high price is due to the action of the Japanese monopoly, and that if Ceylon became a serious competitor, the monopolists could probably lower the price enormously by allowing large harvests for a few years. Hence the cultivation of camphor is not to be recommended as the main industry for any estate, but only as a minor industry.

Class II.: Oils.—The export of cocoanut oil rose from 443,959 cwt. in 1900 to 453,531 in 1901, and that of copra from 362,467 to 439,865 cwt. At the same time there has been a considerable rise in the market value of both these articles, due to short crops in other countries.

The export of citronella oil has also increased from 1,409,058 lb. to 1,430,168 lb., but has not reached the figures of 1899. The investigation of the oils, mentioned in last report, has continued, but is not yet complete. The industry is in a very depressed state, owing to overproduction and adulteration, the latter being so bad that even good local oils do not obtain the value that is really due to them. Prices have reached a very low ebb, 9½ to 10*d.* per lb., and land is going out of cultivation in the grass. On the other hand, the new Java oil, mentioned last year, is selling in increasing quantities at high prices (often 1*s.* 4*d.*). It is not in reality so superior to the best Ceylon oils as the price would indicate, but it is not adulterated, and has no bad reputation to contend against.

Of other oils, the export of cinnamon oil has slightly increased, from 72,904 oz. in 1900 to 73,493 oz., but has not yet reached the figures of past years. Trial plantations of castor oil have been made by various planters during the year; the plant grows well here, and there seems no reason why Ceylon should not export this oil as well as India.

Class III.: Dyes and Tanning Substances.—The export of sapanwood has been 7,180 cwt. Planting of *Acacia decurrens* continues in the higher districts.

Class IV.: Fibres.—There has been a slight decrease in the total export of coir, our chief fibre, the figures being rope 13,030, yarn 75,788, fibre 122,526 cwt., as against 12,572, 87,415, and 115,090 cwt. in 1900. Of palmira and kitul fibres, the export has been 12,353 cwt. and 2,511 cwt. No interest has been taken in other fibres. Sisal hemp is being taken up in India, and the available stock of plants last year was mostly sold to planters there.

Class V.: Drugs.—An investigation of the native drugs of Ceylon is being set on foot, and plots of all possible species are being laid out at Peradeniya (see Mr. Wright's report).

"Of cinchona, the export has materially increased, almost reaching the figures of 1899. Increased interest has been shown in matters relating to this cultivation, and seed has been purchased from abroad and planted in various districts. There is reason to hope that by the planting of improved varieties, and by the practice of grafting of better kinds on poor stocks, this product may again become of importance in Ceylon." (J. B. Carruthers.)

There has been an appreciable export of coca leaves, which have sold on the London market at 1*s.* to 1*s.* 2*d.* per lb., a price equal to that of the South American kinds.

Class VI.: Foods and Edible Products.—Of rice and dry grains there is nothing of special interest to report. The export of cocoanuts has decreased, having been 14,850,781 nuts, as against 14,995,909 in 1900; that of desiccated cocoanut has increased from 13,604,913 lb. to 14,055,493 lb. Tapioca or cassava cultivation continues to spread in the low-country as a minor and catch crop, but no tapioca is made from the tubers, which are eaten like yams. Fruit trees continue to sell steadily from the gardens, but there is but small sign of any attempt to cultivate fruit on any large scale for market, if the long-established industries of cocoanuts and plantains be left out of consideration. The vegetable gardens of Nuwara Eliya have been much troubled with finger and toe disease.

The export of tea seems at last to be reaching its maximum, and shows a slight decrease on the figures of 1900, viz., 145,188,244 lb., against 148,431,639 lb. Part of the decrease is, however, made up by the export of 1,110,774 lb. of green tea, most of which went to America. The export to Russia and Australia has increased, that of black tea to America decreased, but the decrease is more than made up by the green tea. The year has been one of depression, but prospects of the industry are more favourable, the export to England having been 8 million lb. less, and the stock of Ceylon tea there having been considerably reduced. The average price is the lowest as yet recorded, 6·86*d.*, against 7·20*d* in 1900, but towards the end of the year prices were considerably improved. The industry has not suffered from any very serious outbreaks of disease, and planting has not extended. The remarks made last year on the general prospects of tea in Ceylon continue to hold.

Coffee exports show a further fall from 10,777 to 9,722 cwt. Experiments on grafting coffee are in progress in the gardens (see report of Acting Curator).

"Cacao exports show a very large increase on the figures for 1900, being 49,459 cwt. against 33,476. This, as was foretold in last report, is due to some extent to the lateness of the crop of last year, some of which is credited to 1901, but is also largely due to the energetic measures being taken in combating the canker, and especially in reducing the number of diseased pods, the quantity of 'black cacao' having been reduced in some instances by 75 per cent. The prices obtained for cacao, even the best qualities, have been much below those of last year; this is perhaps more due to the conditions of the home market than to any difference in quality of the product, but the increasing proportion of Forastero kinds may have something to do with it. The fall of price should spur planters to consider the questions of cultivation of more productive trees, and the selection of seeds for planting. The canker has, as a rule, been seriously attacked on approved methods, and a marked decrease in the number of diseased trees is apparent. There are, however, many estates where no hindrance is put in the way of the invading fungus." (J. B. Carruthers.)

Of spices there is little to record. The cultivation of cardamoms is extending, and the export has increased from 537,455 to 559,704 lb. Pepper shows signs of extension of cultivation, and it should at least be possible to dispense with the present large import of this spice. Exports of cinnamon show a rise in bales, a fall in chips, the figures for 1900 being 2,678,111 and 1,863,406 lb., and those for the last year 2,756,270 and 1,516,083 lb. respectively. The "wild cinnamon" again shows an enormous fall to 8,581 lb. bales and 5,066 lb. chips. Vanilla planting has slightly extended. Tobacco cultivation continues to extend in the North and also in the Dumbara district. Of fodder plants there is little to report. An experiment with Swedes is described in Mr. Nock's report. The much-vaunted grass *Paspalum dilatatum* is being tried in many districts, and a report will be issued later as to its success.

Class VII.: Timber, &c.—Mr. Wright's work on the ebonies, &c., is described in his report below.

Ornamental Plants.—Cannas and the small white variegated caladiums have been largely in demand through the year.

JOHN C. WILLIS,
Director.

Peradeniya, January 30, 1902.

ENTOMOLOGIST'S REPORT.

DURING the past year the usual work of correspondence, research, and experiment has been carried on. Local correspondence shows an increasing interest in, and appreciation of, the work and aims of the Department. In addition to advice to local planters, letters of inquiry and specimens for report have been repeatedly received from Southern India, especially since the much-to-be-regretted death of Mr. Lionel de Niceville, the talented Entomologist lately attached to the Indian Museum. Owing to the scarcity of students in this particular branch, considerable collections of "scale insects" (*Coccidæ*) have been received from foreign countries for determination.

In January an extended tour was made through the Maskeliya, Dikoya, Bogawantalawa, and Balangoda districts, during which I had an opportunity of investigating on the spot several prominent insect pests, notably the "Tea Tortrix" (*Capua coffearia*, Nietn.), and a kind of "white ant" (*Termes* sp.) that has been doing considerable injury to otherwise healthy tea plants. Meetings of the local branches of the Planters' Association in the same districts were attended, at which information on enconomic entomology was given and discussion invited.

In March a trip to Jaffna, occupying two weeks, was made in company with Dr. Holtermann, a listinguished scientific visitor. The principal object of this tour was to investigate the insect pests of such native-grown products as tobacco, gingelly, palmirah, and the various grains. These crops were found to be remarkably free from attack this year, though several serious pests have been previously reported from the Northern Provinces.

The Gampola district was visited in July, where the "Shot-hole borer" (*Xyleborus fornicatus*)—a serious enemy of the tea plant—was made the special subject of investigation.

In the same month the Rangala district was visited for the purpose of studying a pest of the ardamom plant.

In August a special visit was made to Colombo, at the request of the Municipal Council, to study he habits of the "Lake fly" (*Chironomus* sp.), a pest that has attracted much attention in the neighbour-hood of the Colombo lake. These flies do not cause any actual injury, but make themselves objectionable by their habit of swarming into the bungalows at night (attracted by the lights), invading he food, and immolating themselves in the lamps in enormous numbers. The complete life-history f the insect was discovered, and an exhaustive report made advising the best means of removing he nuisance.

A tour in the Kelani Valley was planned for November in connection with the so-called "Mosquito Blight" of tea (*Helopeltis antonii*). But this visit was postponed until the conditions should be more avourable for study.

Experiments are being conducted, with satisfactory results, to ascertain the connection between ttacks of tea-mites and pruning. These experiments tend to show that injury from these pests may e very largely avoided by regulating the time of pruning, but a longer period is required to obtain ccurate data.

Experiments are also being conducted with a view to the efficient destruction of "white ants" ermites). Various means have been tried, but nothing promises such complete success as bisulphide f carbon, which proved absolutely fatal to these pests in the limited experiments that I was able to nake. The difficulty is that at present, owing to the exceedingly inflammable nature of the gases given ff by the bisulphide, the shipping companies refuse to carry the compound, and it appears impossible o obtain it in any quantity in Ceylon. With the advent of special steamers for the transport of xplosives, this difficulty should eventually be removed.

The question of quarantine continues to receive attention. All Wardian cases received at the otanical Gardens are promptly fumigated with hydrocyanic acid gas before the contained plants are istributed. The Legislative Council has now passed an Ordinance providing for the effective treatment f all imported plants, and a fumigatorium is being erected for the purpose in Colombo. It is hoped hat imported fruit (a fertile source of introduction of noxious insects) will be subjected to similar eatment. The same Ordinance empowers the Government to absolutely prohibit the importation of oclaimed plants from countries known to be subject to specially dangerous pests of such plants.

Sericulture would appear to be an industry particularly suited to the natives of Ceylon. Efforts e being made to introduce a good stock of silkworm, and if the results are satisfactory, it is hoped that e Sinhalese may be induced to interest themselves in the cultivation of silk.

Circulars dealing with the *Helopeltis* insect and the "Mosquito-Malaria" question have been ued from the Department.

Fuller particulars of the miscellaneous work of the division of entomology will be published ortly in the form of a Circular.

E. ERNEST GREEN.

SCIENTIFIC ASSISTANT'S REPORT.

DURING the past year my time has been spent investigating several branches of economic botan and for convenience the report is arranged under separate headings.

Ebony.—The work on Ceylon species of *Diospyros* has been continued, and I have now succeede in obtaining samples of every species known in this Island, together with material from India, Chin Malaya, Australia, and the Andaman Islands. A comparative account of the value of ebony from a countries is being prepared, and to ensure completeness I shall be very grateful if any one intereste will forward specimens of any species of ebony whenever possible. In Ceylon, by direct observatio in the forest, two species have been found, which, though ordinarily regarded as of little value, a capable of producing an ebony which certainly comes second to calamander in point of beauty an hardness. These species (*D. oocarpa*, Thw., and *D. affinis*, Thw.) are not found in the wet zones, b occur, often in abundance, in the intermediate and dry zones of Ceylon.

The greater part of my work has, however, been spent in the forests of the wet zone, and here have been able to find abundance of calamander trees in flower and fruit, together with quantities material of several of our rarest species. One species of ebony (*D. oppositifolia*, Thw.) is limited the upper part of a hill in the Southern Province, and the timber from it was associated by pa botanists with that of calamander. I regret that such is not the case, the timber being, when fresh felled, of a dirty white colour and the centre of the stem invariably hollow. Furthermore, the abun ance of parenchyma, the presence of wide medullary rays, and the large-lumined water-conducti elements which characterize this species prove it to be of poor value when compared with oth *Diospyros* timbers.

Seeds of every Ceylon species have been obtained, propagation by layering and cuttings has be effected, and we have now a representative collection of the Ceylon *Diospyros* growing in these garde

The flowers, hitherto regarded as mainly diœcious (*i.e.*, male and female on different tree have been studied from fresh material in the forest, and in this branch of work many interesting fa of purely systematic value have been obtained. Though in Ceylon we have only twenty species *Diospyros*, yet at least nine of them show a departure from the diœcious condition. Some are mon cious only, others monœcious or diœcious, and others are diœcious or polygamous. The complicat relations determined for the different species show how inadequate an account may be which is bas on examination of herbarium material alone, and the necessity to work out questions concerning t morphology of the flower in the forests.

Many flowers and fruits have been found which are new to science, but an account them, together with remarks on the evolution of sex in Ceylon species of *Diospyros*, will be publish elsewhere.

Guttapercha.—On the suggestion of the Director, an investigation into the yield of gut percha from Ceylon species of *Palaquium* was instituted. This work has been done almost entir in the forests of the wet zone, and up to the present some eight species of *Sapotaceæ* have be experimented with.

The results from two species of *Palaquium*, viz., *P. petiolare*, Engl., and *P. grande*, Engl., ha been satisfactory. The yield of guttapercha from these species exceeded all expectations, since in po of quantity it was in excess of the latex yield from Para rubber trees in Ceylon. Furthermore, there no necessity to fell the tree as is done in Malaya, and though they are of slow growth, they constan bear abundance of fruit.

Samples of the guttapercha have been prepared in various ways, and should the analytical rep upon them prove encouraging, there will be no difficulty in collecting several hundreds of seeds a seedlings from the districts investigated.

Seeds of many other sapotaceous plants have been received from all parts of the world, an comparative account of the nature and development of the laticiferous system in them is now bei arranged.

Medicinal Plants.—A revised account of the medicinal plants now growing in Ceylon is bei prepared. Large experimental plots have been started, and an analysis is being made of the occurre quantity, and nature of the chemical bodies to which the medicinal properties are due.

General.—An analysis of the tea plant is being made in conjunction with Mr. Kelway Bamb and the results obtained, particularly with reference to the occurrence and quantity of the enzy tannin, and starch, the value of certain tests, and the relation of percentage of enzyme to flavour, w soon be placed before the planting community.

Other subjects, such as the comparative value of Ceylon timbers, nitrogen nodules on *Enta scandens*, observations on *Dracæna reflexa*, cleistogamy in *Ruellia tuberosa*, the botany of Hinidu kanda, and the development of sandalwood trees, have received much attention during the past year

HERBERT WRIGHT

EXTRACTS FROM THE REPORT OF THE ACTING CURATOR, PERADENIYA GARDEN.

Cultivation and Experiments.—In this department the main part of the skilled and cooly labour has been used. Large plots of ornamental plants such as cannas, roses, and palms, economic plants such as species of *Crotalaria* now used so extensively as a nitrogenous manure for tea in Ceylon, Para and Ceara rubber, ebonies, guttaperchas, durians, and mangosteens, have been commenced in order to keep up the supply to the public.

Large medicinal plots have been started behind the cattle shed and near the kitchen garden, primarily with the object of making a representative collection of all the more valuable Ceylon species, and secondly, to supply the general public with quantities of especially valuable species. There has been a fair demand for *Brucea Sumatrana*, *Wrightia zeylanica*, *and Ixora coccinea* during the year.

A plot behind the Curator's office has been allotted for the experimental cultivation of fourteen kinds of cocoanut presented to the gardens by W. H. Wright, Esq., Mirigama. In this collection it is satisfactory to note that many of the nuts, particularly the Siam, Maldive, and King varieties, have already begun to sprout. This is a valuable contribution to the garden, and every care is being taken to rear healthy plants.

Experimental cultivations have been established for sandalwood trees. Pot and plot experiments are being carried on in all conditions of soil. We hope to settle whether they are ever parasitic, and the best conditions for development.

Grafting, Layering, and Cuttings.—The Java method of grafting has been used in many of our experiments. "The scion is cut from green wood, and the notch is cut in green wood of the stock. The scion is cut about half inch below the leaves with long cuts on both sides to a long V-shaped apex. A corresponding notch is made in the stock, starting between two leaves. The leaves of the scion and of stock are removed at and just below the graft. The graft is then tightly bound with wax and bark, and a small glass test tube is placed over the whole to keep the air damp, &c." An improvement has been made in this experiment, which enables us to maintain an equable temperature and humidity in the region of the graft.

Coffee.—In the grafting experiments with coffee, I have been principally concerned in determining the ease with which one kind can be grafted on to another. We have tried Arabian, Liberian, Stenophylla, and hybrid coffees with one another, sometimes having the stock an established tree, at other times in bamboo pots. The best results have been obtained with Arabian stock and Liberian scion, and with these reversed.

Mangoes.—Grafting in mangoes is invariably easily accomplished. The Jaffna mango has been grafted on to rupee and honey mangoes, and many others distinguished by the native names, *kohu-amba*, *girawe-amba*, *me-amba*, can be grafted easily with one another.

Oranges.—In this division the mandarin has been successfully grafted on to *Citrus indica* and *C. Limonellus*, and the latter on to the mandarin. We are hopeful that good results may yet be obtained in this direction, and experiments will be repeatedly made during the rainy seasons.

Nutmegs.—In order to try and reduce the number of males in plants exported from the gardens, a considerable number of saplings have been grafted by approach. Propagation by layering, leading to an increase of the female trees, has been tried, with some success; in these experiments only 10 per cent. of the layerings rooted, but a considerable increase can be assured by more careful work. We have repeatedly tried grafting female on male trees and *vice versâ*, but so far have no good results to report. In two cases only were we successful in grafting trees in bearing on to sapling stocks: this was by the "approach" method, and not by fitting scion into incision of stock.

Mangosteen. — Successful experiments have been made in layering, but the grafting of the mangosteen on to the Cochin *goraka* is not so easy a matter. We have reason to expect that good results can be obtained by grafting these by approach in the sapling stage, and for this purpose the whole of the year's seed supply of mangosteens has been reserved.

Cacao.—We have been successful in grafting one variety on to another in about 30 per cent. of the experiments. In layering and reproduction from cuttings much labour has been spent. The only successful cuttings have been in soil which is very sandy, practically free from all leaf mould, and supplied with running water at irregular intervals. In one set of cuttings only those situated along the course of a small stream, and therefore subject to occasional miniature floods, were successful. This is an important point to note. The cuttings were taken at all ages, but only the woody ones about as thick as a man's finger were of any use. Young twigs with young and mature leaves were tried in pots of sand covered with glass bell jars, but gave no successful results.

Attempts were made to reproduce the slowest growing of our tropical trees from cuttings, and we are able to report good results in species of *Diospyros*. A large number of *Amherstia nobilis* trees have been layered, but as yet nothing definite can be stated. If we can successfully reproduce this plant it will be a public boon, as its gorgeous flowers render it one of the most beautiful of ornamental trees.* Reproduction of roses by inverting the cuttings and using the heat of the sun's rays as the source of "bottom heat" have been partially successful.

Fruit Trees.—The past year has been very good. The only fruit-bearing tree of the mangosteen in these gardens gave excellent results, no less than 627 fruits being obtained from it during August and September. As previously mentioned, the whole of the seed supply from this tree has been reserved for grafting experiments.

The mangoes were, as usual, a great success, thousands of fruits having being collected during the season. The same can be said of the Cochin *goraka* and the *Rambutans*.

The durians have this year yielded an abundance of fruit. The trees alongside the river drive near the laboratory gave the best results, five of them giving no less than 243 large ripe fruits. The fruits were sold at from 25 cents to Re. 1 each, and the saplings, four or more of which can be obtained from every fruit, realize 25 cents each. It is conceivable that a few acres of the above fruit trees in bearing might turn out very profitable, since they will thrive on poor soils without much attention.

A plant of the "Cannon Ball tree" was planted by T. R. H. The Duke and Duchess of Cornwall and York near the laboratory, and is growing vigorously.

Visitors.—The gardens were visited on 14th April by T. R. H. The Duke and Duchess of Cornwall and York and suite. A memorial tree was planted by them in the Great Circle, near the laboratory. Tea was provided in a pandal erected upon the Great Lawn, and an exhibition of elephants bathing in the river concluded the afternoon. The number of foreign visitors during the past year (2,293) shows a slight decrease on that for 1900.

Weather.—The heaviest rainfalls were during the months of April, June, and November, it being 12·03, 14·27, and 18·59 inches respectively. The month of February was the driest in the year, rain falling on four days only, and totalling up to 1·73 inch. The month of December was remarkable for great wind velocity, and a small rainfall of only 4·72 inches. The total year's rainfall is small compared with that of 1900. The following is the year's rainfall with the average of each month for the last eighteen years :—

	1901.		Average for last Eighteen Years.	
Months.	Inches.	Days.	Inches.	Days.
January ...	2·00	7	2·88	6·16

Total Rainfall for 1901	84·11	184

HERBERT WRIGHT.

EXTRACTS FROM THE REPORT OF THE SUPERINTENDENT, HAKGALA GARDEN.

A batch of camphor seeds were sown at the end of February, and 5,000 plants were raised from them. The seeds took from two to three months to germinate. Of the camphor cuttings mentioned in last year's report, I regret to state that only about 10 per cent. struck root. As plants can be so easily raised from seeds or layers, it is a waste of time and labour to raise them from cuttings, as the process is difficult and costly.

---

* Since writing the above I have examined several plants and am able to report that several of the layers have rooted.—H. W.

The English laurel has now become established in the gardens, and 200 cuttings and 56 layers have been put down in the nurseries, and all look well.

The available stocks for grafting were very poor this year, but some scions of apples and plums have been grafted on to the best of them.

As will be seen below, a great deal of work was done in the nursery during the year in the way of propagating and distributing plants. The number of economic and ornamental trees, fruit trees, and general garden plants distributed during the year was 22,405, besides 1,420 cuttings and 67 packets of seeds. The number of plants—chiefly conifers and ornamental trees and shrubs—that were propagated and supplied gratis to the Board of Improvement, Nuwara Eliya, was no less than 12,668, and 620 were supplied for the grounds at the Diyatalawa Camp.

Borders and Shrubberies, Improvements, &c.—118,523 plants of ornamental trees and shrubs, herbaceous plants, and general garden plants and bulbs were set out during the year in the upkeep of the gardens, the majority, as usual, being showy annuals and edging plants.

Much damage was done in various parts of the gardens by the high winds in June and July, and a good deal of labour was employed in cutting up fallen trees and clearing away *débris.*

The filling in of the lower side of the drive opposite the lower lakelet was completed in January, and 230 square yards of turf was laid down there, which now forms a belt of nice green lawn.

Some improvements were made at the back of the Picnic Arbour. The ground was dug up under the acacia trees and 195 square yards of turf laid down.

A new border, 48 feet long, has been made on the north-east side of the eucalyptus clump and planted with various kinds of liliaceous plants.

The patana around the new laboratory was cleared of undergrowth and weeds, a new 4-foot wide path 234 ft. long was made leading to this building, and 98 square yards of turf was laid on the banks in front.

Fifty large plants of *Cupressus macrocarpa* were planted in the land between the fernery and old eucalyptus plantation. Two hundred assorted plants that have become too large for the nursery were also planted out in this land.

The forest track leading from the upper part of the gardens to the large pool under the Hakgala rock has been cleared for a distance of 762 yards, so that it can be used with ease for bringing out posts, fence sticks, and other forest produce frequently required in the gardens.

Classified Herbaceous Garden.—The bank on the east side of this garden, which was broken away by the heavy rains in March, has been rebuilt and turfed.

Rose Garden and Rose Borders.—The rose plants in the several borders flowered very well at the beginning of the year, producing some really fine blooms, but those in the rose garden proper have not done at all well. These latter were all pruned, lifted, and re-planted during July and August. Although some plants have answered to this treatment, the majority have not improved, and I am afraid they will never do any good again. A fresh stock from Europe is now required to replace them.

Flower Garden and Flowers.—No alterations or additions were made in the flower garden, but the usual display of flowers was maintained. The flowers in the beds and borders in other parts of the gardens made a good show from January until the end of May and again in August and September.

A plant of *Magnolia grandiflora* flowered well during November and December. Several of its handsome pure white flowers measured over 10 inches in diameter.

Calophyllum Walkeri, the "Kina Tree" of the Sinhalese.—It may be interesting to state that thousands of these trees flowered most profusely during the first three months of the year. The masses of white flowers in all the forests in this locality were very noticeable.

Casuarina Plantation.—The plantation of *Casuarina montana* has continued to thrive during the year. A small strip of land at the bottom, and another at the top has been cleared and planted with 275 more plants.

Villebrunia Integrifolia.—The cinchona planted on the plot of land cleared last year below the camphor plantation was all destroyed by sambur deer. This land has now been planted with *Villebrunia integrifolia*, an indigenous plant said to yield an excellent fibre.

Quercus Cerris, "Turkey Oak."—A piece of land above, and to the west of, the *Casuarina* plantation has been cleared up and planted with 1,000 plants of the Turkey oak. This piece of land is good, well sheltered, and it is presumed that this species of oak will do well in it.

Camphor.—The plants in the small plantation have continued to grow well. Several batches of specimens of the leaves and twigs have been forwarded to Mr. Bamber for further experiment in distillation. Six samples of the soil they are growing in were supplied to him for analysis in August, and

the very interesting results are published in the Royal Botanic Gardens Circular No 24 published in November. Many inquiries have been made about camphor cultivation during the year, and all have received attention. 2,000 plants have been distributed, and we now have about 4,000 more ready for sending out.

Mana Grass.—Four bundles, 40 lb. each, of this grass, from four different localities, have been supplied Mr. Bamber for distillation.

Ferns.—Six plants of the indigenous tree fern *Alsophila crinita*, with stems 5 to 6 feet long, were despatched in March for the Botanic Gardens at Munich. Large quantities of maiden hair plants and several thousands of fern fronds were supplied to Queen's House and to the King's Pavilion for decorations during the Royal visit in April.

New Cart Road to Ambawela Railway Station.—This road is now completed. We sent the first cart through on the 11th February. It is only 7 miles by this road to Ambawela station, against 9 miles to Nanu-oya. On the return journey there is only about 1½ mile of uphill, instead of 4 miles as is the case from Nanu-oya.

Fruit Trees.—Seeds of a good mango were received from the Director of Agriculture, Madagascar, in May, and fourteen plants have been raised from them. These seeds were from trees growing at an elevation of 4,200 feet, and it is thought that they will produce plants that would fruit at the higher elevations in this Island.

Three dozen assorted fruit tree plants were received in July, through the Director, from Australia, but I regret to report that two-thirds of them were quite dead on arrival. Of the remainder, all the figs and a few oranges revived, and are now doing well.

Paspalum Dilatatum.—A small plot of this fodder was sown in the nursery and has grown well. All stock eat it greedily, and it promises to become a very useful addition to the fodders of the up-country districts.

Swedes.—An ounce of seeds of a variety called "Defiance" was sown on the 23rd July on a piece of land 48 square yards. They came up well, and were carefully cultivated, and grew splendidly. The crop was taken up on the 9th December—4½ months from the time of sowing—the yield being 280 lb., or at the rate of 12½ tons to the acre. The largest weighed 8 lb., and measured 24 inches in circumference. The six heaviest weighed 30 lb., the twelve heaviest 52 lb., and the twenty-five heaviest 91 lb. These roots, which are easily produced, possess grand feeding qualities, and if our local butchers would only feed their cattle on them for a month or two before slaughtering, the quality and flavour of the Ceylon beef would be very much improved.

Oxalis.—This pest has continued to spread. The nature of its growth makes it a most difficult plant to eradicate. Nothing but picking out by the hand and burning the tubers seems to have any effect on it. 68¼ bushels have been picked out of the nursery and borders during the year. This represents 300 to 400 days' labour.

A weed killer was tried on a small patch, but it simply killed the foliage, and after a few weeks the bulbs grew with renewed vigour. It has now got such a hold of the gardens that, unless some enemy or disease can be introduced to destroy it, it will be impossible to keep it down.

Barbed Wire Fence.—A special vote was granted for wire fencing, and a barbed wire fence has been fixed all round the inner boundary, enclosing about 46 acres. This fence is made of five strands of 4-point barbed wire, fixed on posts 9 feet apart and 5 feet 6 inches high, the total length being 2,062 yards.

A belt of land 24 feet wide has been cleared all round the inner side and planted up with 6,000 plants of the following trees:—*Acacia decurrens*, *Acacia melanoxylon*, *Frenela rhomboidea*, and *Cupressus macrocarpa*, the latter being planted 50 feet apart with the view of their growing into large timber trees. Seven gates have been fixed at convenient points, and galvanized wire netting has been purchased for fixing along the upper boundary on the forest side in the hope of keeping out small wild animals, such as mouse-deer, porcupines, hares, &c.

Water Service.—A special vote was made to the Public Works Department to bring a supply of water to the gardens. This has been accomplished by damming a permanent stream at Sita Eliya, from which 2-inch piping has been laid, leading the water into the old reservoir in the upper part of the gardens, the distance being about 1½ mile. This supplies a long-felt want, and when the proposed connections are made with the bungalow, laboratory, Foreman's quarters, nurseries, and other parts of the gardens, it will be a great boon, and will greatly facilitate the cultivation and general work of the gardens.

The following table shows the monthly rainfall and averages from July, 1883, to the end of 1901 and the number of days on which rain fell during the 20 years 1882 to 1901, inclusive :—

		Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.

The greatest pressure of the wind during the year was 6·840 lb. per square foot on the 5th June, equalling a velocity of 36 miles an hour, against the same pressure on the 12th June last year.

The mean daily horizontal movement of the air for the year was 84·85 miles, against 90·88 miles of the year before.

The windiest month was again June, with a mean daily horizontal movement of 185·60 miles, against 223·30 miles of the same month last year.

The calmest month this year was January, with a mean of 25·14 miles, against 25·50 miles in February of the year before.

The highest temperature of the sun's rays was 131·0 on the 28th May, against 129·0 on the 1st and 21st and 25th May last year.

The lowest on grass was 33·0 on the 27th January.

* Rainfall of half year.
‡ Average of 18 years January to June, and 19 years July to December.
† Average of 20 years.
§ Average of 18 years.

The mean amount of cloud was 6·8, against 6·5 of that of the year before.

The cloudiest month was January, with a mean of 8·0, against 8·1 in November of last year.

The brightest months were March and May, with a mean of 6·0, against February and March of the year before, with a mean of 4·5 each.

W. NOCK.

HENARATGODA GARDEN.

THE late Conductor having resigned during the year, Mr. W. Perera, First Foreman at Peradeniya, was appointed in his place. A complete overhaul and re-organization of the garden is now being carried out. The main road has been gravelled and ditched, new walks opened, many new flower beds planted, and the general condition of the garden improved. Several experimental plots of rubber, tea, &c., now no longer needed, have been cleared to make room for trials of other things. It is intended in 1902 to catalogue the entire garden, and to plant several new experimental plots. 21(visitors, other than parties, visited the garden in 1901. The rainfall for the year has been—

	Inches.	Days.		Inches.	Days.
January	8·54	13	July	9 25	15
February	5·79	11	August	1·80	12
March	5·07	14	September	2·37	10
April	10·88	18	October	11·23	11
May	10·94	19	November	19·51	20
June	15·66	27	December	3 69	6

Total, 104·73 inches on 176 days, against 100·83 inches on 177 days in 1900.

The average for the eleven years 1891–1901 is 100·37 inches on 163 days.

ANURADHAPURA GARDEN.

THE garden has been kept in good order. Watering in the long dry season consumes a larg part of the labour, and a better water supply would be a great boon. The flower beds have been ver effective in display, and many so-called English flowers have done well.

Fruit trees continue to be distributed in the district by the aid of the Government Agent, an 336 have been issued in this way during the year.

BADULLA GARDEN.

THE Conductor having been promoted to Hakgala during the year has been succeeded by Mr D. T. de Alwis from Peradeniya. The garden has been kept in good order, and is now a gre ornament to the town. New cooly lines and plant sheds are much needed.

Pimento has fruited well, and should be worth trial in Uva. *Paspalum dilatatum*, the ne Australian fodder grass, has also grown well.

LITERARY REGISTER SUPPLEMENT:

AND CEYLON

"NOTES AND QUERIES."

[Under this heading, in future, we mean to give a four or eight page "Supplement" with our *Tropical Agriculturist*, from quarter to quarter, according as there is matter of sufficient value so to be preserved.]

AUGUST, 1901.

THE SINHALESE LANGUAGE: ITS ORIGIN AND STRUCTURE.*

A REVIEW.

(Communicated.)

WHERE THE SINHALESE CAME FROM AND HOW THEY GOT THEIR LANGUAGE.

Some years ago the late Dr. Rost, Librarian of the India Office, in writing to a friend of the writer, remarked on the growing interest manifested by European scholars in the language and literature of Ceylon and lamented the want of facilities afforded to the Continental student in procuring books published in this island. That this interest in the subject has grown with years and has borne good fruit appears from an elaborate treatise just published in Germany by the Erlangen Professor of Sanskrit.

Dr. Geiger, who spent some time in Ceylon collecting materials for his great work, has clearly indicated the exact place that Sinhalese occupies in the family of languages, its near kinship to Mahrathi; and has ascertained its original home to have been in the North-West Provinces. Before the Professor came into the field, the ethnological questions regarding the origin of the Sinhalese had long since been settled and the verdict of the historical scholar that they are an Aryan people has been strangely confirmed by the philological student. Though the history and origin of the Sinhalese people have long been examined carefully by Orientalists at home and abroad, the subject of their language had not received that critical attention which it deserved. But we may no longer complain; light has burst from two opposite quarters, from the East and West, when it was least expected. Simultaneous with the publication of Prof. Geiger's work in Germany, there is published in Ceylon an interesting brochure, with the title of the heading of this article, by that veteran Sinhalese scholar, Mr. W P Ranesinghe. Both students have had the courage to grapple with a subject, which has for a long time baffled Orientalists, owing to its intricacy, and although working independently they have arrived at practically the same conclusions. It is foreign to my purpose to notice at length the work of the German *savant*, and I shall turn with interest to the no less important contribution by the Sinhalese scholar.

Mr. Ranesinghe, in his preface, after reviewing the efforts hitherto made to show the affinity of the Sinhalese language to Sanskrit, Pali, and Hindi, says :—"But no effort has been made in either of these treatises to set forth the various changes which words have undergone in their passage from Sanskrit, Pali, and the Prakrits into Sinhalese; much less to account for such changes. I have attempted to show the changes, and to find reasons for most of the changes which these words have undergone. While engaged in this task I found that there was a certain uniformity in the way these changes had taken place, and that they are regulated by certain fixed principles. I have sought to deduce these underlying principles and have set them forth as rules, supporting my position in each case by several examples. I have also not thought it foreign to my purpose to print the Indo-Aryan equivalents side by side with their Sinhalese cognates, so that the reader may see at a glance how nearly related Sinhalese stands to the Sanskritic dialects of Modern India."

Mr Ranesinghe has here given us an insight as to the method of his work, and the difficulty of his task can only be realised by those who have attempted any similar work. The author can fairly claim the credit of having made the "first attempt to reduce the intricate subject of Sinhalese word-formation into scientific form" and the success he has achieved is as much due to his energy as to his intimate knowledge of the Sinhalese language and the heterogeneous elements which go to the composition of it.

The book contains four chapters, the first two of which include letter-press dealing with the origin of the Sinhalese language, whence it is derived, and the nature of the characters in which it is written. The interesting problem, as to what language Prince Wijaya and his war-band spoke, is here discussed, and for the first time a satisfactory solution is offered. "The language of

* The Sinhalese Language: Its Origin and Structure, London. Luzac & Co. 1s 6d; Colombo R1.

Wijaya and his followers," summarises Mr. Ranesinghe, "could not have been Pali, as that language is now known to us, but it must have been Prakrit or corrupt Pali, which, Professor Max Müller says, was the parent of all the Aryan vernaculars of India, and this supposition is confirmed by the fact that the early rock inscriptions in Ceylon are in a corrupt Prakrit."—p 3. Another misapprehension which the book will remove is in regard to the term Elu, whose derivation has baffled some older scholars who considered it to be a special poetical dialect of the Sinhalese. In the first page of his book Mr. Ranesinghe shows the word Elu to be no other than a different form or derivative of the term Sinhala. Professor R C Childers first pointed this out some years ago in a paper contributed to the Royal Asiatic Society of Great Britain and Ireland, and Mr. Ranesinghe has further traced the derivation of the term. As regards the form of the Sinhalese letters the author says that "an examination of the. Lát characters, in which the ancient rock inscriptions of Ceylon are inscribed, with their development from time to time, will clearly shew that the modern Sinhalese letters are evolved from them, and those letters that are not found in the inscriptions and peculiar to Sanskrit are taken from the Dewa Nagara."

The book is an excellent production of the kind and by its publication Mr Ranesnighe has rendered a great service to Philological Science. The work when complete—for it is only the first part that is out—should go a great way to supply what is so much needed: a Historical Grammar of the Sinhalese Language, a volume to occupy the place so admirably filled in England by Dr Morris's Grammar. It may be added that the book is very neatly and carefully got-up by the Government Printer, and I have succeeded in detecting only one typographical error, *e.g.*, the title of ch : II. for ch : III. at the head of the latter chapter which has not been noted in the "errata" column.—LIBRA.

THE GEOLOGY OF CEYLON.

We omitted yesterday to call attention to the able review by Mr. A. K. Coomaraswamy—now in the island—of a learned paper by a German scientist on the geology of Ceylon, or rather on the department affecting our plumbago deposits and granulitic rocks. Professor Weinschenk arrives at conclusions as to the geological sequence of events in Ceylon, which are no doubt satisfactory to his fellow-scientists but which we confess are rather puzzling to our ordinary non-scientific lay mind. Mr. Coomaraswamy would be doing a service if he interpreted the learned German's conclusions into language that might be "understanded of the common people", and still more. if he would show us how far progress has been made in explaining two of the most mysterious rocks in our earth's crust, which are abundant in Ceylon, namely. laterite or cabook and graphite or plumbago. Where the iron of the one came from and the carbon of the other, we have always understood that even the most accomplished geologists would be chary of dogmatically affirming About low-level laterite something may be said; but gneiss and other rocks passing into laterite on the top of a hill is another question. Equally difficult is it to say whether graphite was deposited from water or solidified from gas. We would like to know if the German Professor explains why the mineral should have so strong an affinity to quartz, or is this still amongst the as yet unsolved problems of the science of Geology ? We would again press for the Geological Survey so long promised and talked of, to take up the work systematically for the island as a whole, and we trust to see Mr. Coomaraswamy's services retained and utilised by the Government when that Survey actually begins.

[Extracted from the GEOLOGICAL MAGAZINE, Decade IV, Vol. VIII, No. 442, p, 175, Apil, 1901.]

E. Weinschenck. Zur Kenntniss der Graphitlagerstätten. III. Die Graphitlagerstätten der Insel Ceylon. Abh. k. bay. akad. Wiss, Cl. II, Bd. xxi, Abth. 11 ; München, 1900.

Professor Weinschenck has examined a series of rock and vein specimens from the graphite mines of Ragedara, Ampe, Pushena, and Humbuluwa, in Ceylon, collected by Dr Grunling. He discusses the nature of the granulitic rocks and the mode of occurrence and origin of the graphite.

A general petrographical description of the granulitic rocks is given, illustrated by three plates of microphotographs. Massive habit, granulitic structure, and variable chemical composition are characteristic. Except in the more basic varieties, intergrowths of two felspars are very noticeable. The granulitic rocks include a continuous series ranging from aplites (weiss-steine) to pyroxeneplagioclase rocks (trapp-granuliten) and even pyroxenites. A rather oily lustre and greenish colour are very characteristic features. The constituent minerals are in a remarkably fresh condition, except in the immediate neighbourhood of the graphite veins. It is interesting to note that Professor Weinschenck does not mention any pleochroic monoclinic pyroxene.

There are certain other rocks in Ceylon which include coarse-grained dolomites and 'cipolins,' containing blue apatite and contact mineral such as forsterite, chondrodite, phlogopite and spinel, and also the peculiar andaluste, sillimanite, and corundum bearing rocks described by Lacroix.

The granulitic rocks show no trace of the operation of dynamic causes ; they are regarded as an eruptive mass which may form a single unit or be compound in character. The occurrence of coarse crystalline dolomites in the midst of the granulitic series seems to show that different eruptive units are separated by contact rocks. The existence of still younger eruptive masses of granite has not yet been demonstrated, for the few rocks as yet described from Ceylon as granite are rather varieties of the granulitic series.

Professor Weinschenck compares the Saxon and Ceylon granulites, thinking with Naumann that the former are truly eruptive rocks. Had the Ceylon rocks been studied before those of Saxony this view would have been more widely held. They differ from the Saxon rocks chiefly in their non-schistos character and coarser grain. Lehmann regarded the peculiarities of the Saxon granulites as the result of dynamo-metamorphism. He regarded the microperthitic intergrowths of two felspars as the result of such a process, but as these are

characteristic of quite unaltered rocks in Ceylon they may also be original in the Saxon rocks. The absence of sericite in the latter presents a difficulty to those who favour the dynamo-metamorphic view. Lehmann supposed that its place was taken by biotite, but this mineral is not infrequently an original constituent in Ceylon rocks. Garnets are characteristic of typical granulites, and their presence is the result of chemical peculiarities in the magma or peculiar physical conditions obtaining at the time of its consolidation. The chemical composition of Ceylon and Saxon granulites resembles those of truly igneous rocks. Perhaps in Saxony we are dealing only with the outer margin of an eruptive mass intruded into surrounding schistose rocks, while in Ceylon the heart of the eruptive mass is exposed. In both cases there has been extensive magmatic differentiation, and this may be cousiderd characteristic of granulites in general.

It is only in immediate contact with the graphite veins that the granulite matrix is chemically altered and finally impregnated with graphite. Fragments of rocks included in the veins are also specially affected. In altered rocks the felspars are largely changed to nontronite, a feature associated with the occurrence of graphite in the Passau district also. The pyroxenes change to a fine scaly material with aggregate polarisation. Mica and garnet alter less readily. Impregnation with rutile and titanite is characteristic, as in the Bavario-Bohemian area. Beside the rock fragments, pieces of various minerals occur in the veins—quartz, pyrite, orthoclase, microperthite, apatite, biotite, augite—the formation of these being previous to that of the graphite; while calcite, and sometimes biotite, seem to have been deposited contemporaneously.

In the Passau district (Bavaria) the formation of nontronite and impregnation with graphite affect the whole schistose complex, while in Ceylon the graphite occurs in veins. This difference depends chiefly on the harder and more massive character of the Ceylon rocks. In Ceylon, Siberia and Cumberland the graphite occurs in veins; in Passau and Ticonderoga (U. S. A.) in veins and beds; in Bohemia in beds: these differences depend on the varied character of the matrix and not on different modes of origin of the graphite. Emanations of carbon monoxide, with or without cyanogen-bearing compounds, may have given rise to the graphite veins; while the introduction of iron oxide and manganese peroxide in their neighbourhood may argue that metal carbonyls were also present.

Finally Professor Weinschenck would suppose the following to have been the sequence of events in Ceylon:—A fluid magma intruded into beds of unknown age consolidated as a peculiar 'schlierig' rock, while contact-metamorphic structures were developed in surrounding beds. Contraction-joints developed on cooling, allowed the formation of pegmatites, including pure quartz veins to some extent. But, contemporaneously with the formation of the pegmatite, there were emanations of carbon monoxide and cyanogen-bearing compounds, which followed the same paths as the pegmatites and then gave rise to the graphite veins. The system of veins traversing the whole massif played in latter mountain movements the rôle of buffer, the soft yielding mineral absorbing the mechanical effects, and thus the Ceylon granulites remained unaltered by dynamic changes.

I have attempted in this review merely to give and abstract of Professor Weinschenck's views as expressed in his important paper.

A. K. COOMARA-SWAMY.

VISIT TO A CINGALESE INSANE ASYLUM.

BY A NURSE GLOBE-TROTTER.

Seven o'clock in the morning according to English ideas of time is a most unsuitable hour at which to visit a public institution. In Ceylon a before-breakfast round of a hospital or asylum is quite "the thing." Later on, the stifling heat makes up-and-down-stair visitation a penance and weariness to the flesh. Unlike most tropical institutions, which are commonly built on one floor, bungalow fashion, the huge insane Asylum at Colombo possesses many stairs and an upper storey.

Accordingly, at 7 a.m. punctually, after a drive through the lovely Cinnamon Gardens, which are the joy of generations of globe-trotters, one of the highest officials of Ceylon and I explored the wilderness of tropical trees, flowers and gorgeous blossoms, in which the vast insane Asylum of Colombo, containing some 1,200 patients, stands. The patients, like ourselves, had taken an early cup of tea and bread and butter, the more substantial breakfast which we subsequently saw in process of being cooked is served at about 10 a.m. It was the Europeans who taught the Cingalese to drink tea, a habit which has now become inveterate and exaggerated in native family life.

The asylum household had been up and busy for about a couple of hours before our arrival, groups of semi-safe patients were scattered under the shade of the trees, for even at this early hour the sun was sufficiently strong to make a shelter from its rays both grateful and comforting.

They were squatting native fashion on the grass, chattering, crying and laughing in turns. Most of the men were smoking; some were dressed in the Cingalese "half petticoat," wearing turbans made from several yards of linen wound about their heads; others were garbed cooly fashion in a single wide loin cloth.

A DRAWBACK TO GOOD NURSING.

The native ideal of bliss is to squat eternally—and talk eternally. Before visiting the East I had accepted the "grave quiet Oriental" of literature as a gospel truth, but as a matter of fact neither the man nor the woman of the East ever stops talking. They stay awake most of the night, because the day has not been long enough to give them time to say all they want to. And if by some chance sleep overcomes a native he still goes on talking. This incessant chatter is a terrible drawback to good nursing, both in Ceylon and India. For the nurse finds it a most difficult matter to obtain absolute quiet for her patient, either in the daytime or the still small hours of nights. The punkah puller's wife and family cannot be prevented from camping out with him day and night, so as to form a cheery conversation party. The incessant prayer of a patient in the East is for one hour's real rest. For if the humans can be silenced by superhuman effort, threats and fines, the flying foxes, monkeys, jackals, and crows all have their noisy innings till a sick man's nerves grow raw with noise.

AMUSEMENTS.

The amusements of a Cingalese Asylum are few and far between. Natives play very few games, though they are incessant dice-throwers and

gamblers. Amusements such as are common in the home asylums would not be a success if they were introduced in the East. None of the inmates would know what to make of a piano. The only form of music appreciated by the Cingalese is that resulting from the tom-tom and a gruesome imitation of a bagpipe. All other harmonies would be regarded as weary, stale, and unprofitable. Since the beating of tom-toms could hardly be permitted for the sake of the sanity of doctors and nurses—the routine seemed somewhat dull from the European stand-point. But the native does not find it so.

THE NURSING STAFF.

The matron and all the head nurses are Burghers, which means that they are of Dutch extraction with a more less commingling of native blood. The Burgher of Ceylon corresponds to the Eurasian of India. There is a large staff of Cingalese attendants in addition, who do duty of a non-nursing kind. The patient help to cook, do most of the domestic housework, keep the grounds in order, saw and assist the native and quite sane cooks. Some of the patients, recognising the important official who accompanied me, removed the cloth from their shoulders, this being the highest mark of respect to his superiors that a native can show.

HOMICIDAL PATIENTS.

Many of the patients are homicidal, but the medical superintendent told us that epilepsy and epileptiform varieties of insanity are not nearly as common in Ceylon as at home. An old lady was pointed out to us whose greatest boast and pride in life rests in the fact that she cut her husband literally and truly into tiny shreds. She looked very crude and primitive, as most of the Cingalese do, but there was nothing markedly ferocious about her appearance. Among the other patients she is a kind of heroine from the complete and unusual nature of her crime. The Cingalese temperament is rarely violent or cruel, though it is treacherous to a degree. It is a somewhat curious fact that the insane male natives we saw looked far more manly and decided than sane Cingalese men usually do. For it is a proverbial truth that the average Cingalese man looks "rather more like a woman than a real woman does." It was very touching to see an old insane native woman bestowing such tender care on her blind, insane, and grown-up daughter, whom she tends and watches and cares for as though she were an infant. Maternal devotion is characterisitc of the natives of Ceylon, and cruelty or even mild unkindness to children is very rare in the island

COOKING AND THE DIET.

The kitchen presented a novel scene. All the cooking—and capital cooking, too—is done picnic fashion, by means of a few smouldering logs and primitive saucepans. An old man patient—and we were relieved to hear that he was not classed with the homicides—was brandishing a big knife and shredding some fifty fresh half-coconuts for use in the breakfast curry. After the nut is cut in fine shreds, it is rolled with the most crude kind of native rolling pin, before it is added to the curry pot. Other patients were busily slicing the Bombay duck and somewhat "high" salted fish, without which and some twenty other odd vegetable and pickled compounds the native curry of the country would not be considered complete. Nice-looking rice "hoppers" were in process of preparation. the rice previously boiled being mixed with coconut oil into a consistent mass and fried in small portions, like pancake or fritters. It takes a native to swallow, enjoy, and digest the strong rancid coconut oil which enters so largely into Cingalese cookery. Some of the patients were lepers, for leprosy is not yet compulsorily segregated in Ceylon. Many have become insane through immoderate drinking of the strong and deadly arrack spirit or toddy which the native distills so cleverly from coconut flowers. Indeed, he is very skilful at extracting strong drinks from almost any tree.

GOVERNING BY KINDNESS.

The cubic space for each patient, judged by the British point of view, is enormous, but, of course, more air space is needed in the tropics. Very little restraint is used, and a strong effort is made to govern by kindness and moral suasion rather than by a show of force. The patients appeared to be devoted to their doctors, some of whom are English, while others are "Burghers," who have mostly taken their medical degrees at Edinburgh. One old man, who was rather a bad case, hearing of our contemplated visit, determined to honour the occasion by gathering the most gaudy and resplendent tropical blossoms from the grounds. In the absence of flower vases he had filled two pairs of shoes, borrowed for that purpose from a European source, since the native wears only the hardened skin shoes wherewith nature endows him. Bright with tropical blossoms most tastefully arranged, four shoes stood ranged outside his cell door, and he proudly did the honours of the flower show. He had calculated on a money result—and he got it. It is impossible to visit and study the workings of this huge Insane Asylum of Colombo without being impressed with its admirable methods. Indeed, the Asylum ranks high in the estimation of all who are familiar with it, and it is popularly allowed to be "a credit to Ceylon."—"*Hospital*" *Nursing Mirror.*

Supplement to this day's issue.

COFFEE AND PEPPER EXPORTS FROM WESTERN INDIA.

To the Editor, "Ceylon Observer," Colombo.

Tellicherry, 23rd Sept. 1901.

DEAR SIR,—I have the pleasure to furnish you with my annual statement Exports of Coffee and Pepper for the year ending 30th June, 1901, the total figures of which approximately represent what the crops of these products in India, for the year in question, amounted to. As usual, I further show the distribution of shipments to various ports, and have added the figures relating to exports for the three previous years for the purpose of comparison.

COFFEE.—The crop for the past year was some 74 per cent. in excess of that of 1899-1900 by far the larger proportion of which was shipped from the port of Mangalore. Of the total quantity shipped cwts 255,046 may be regarded as plantation, and the balance cwts. 107,137 as native coffee. The prices fluctuated to such an extent that I find it impossible to arrive at an accurate average value of the coffee exported, but if the average value of both plantation and native coffee be taken at say R650 per ton f.o.b., the total value of coffee exported during the year amounts to R11,770,947-8-0.

PEPPER.—The total exports of this spice amounted to cwts 211,987, or some 26 per cent. more than was shipped last year, the value of which at an average of R37-8-0 per cwt. amounts to R7,949,512-8-0. Tellicherry is still the chief port of export for this spice.—I am, dear sir, yours faithfully,

C. W. LAYARD, for Agent, Arbuthnot & Co.

MESSRS. ARBUTHNOT & COMPANY'S ANNUAL STATEMENT OF EXPORTS OF COFFEE AND PEPPER FROM SOUTHERN INDIA DURING THE SEASON ENDING 30TH JUNE 1901.

☞ It has been ascertained by reference to the Customs Returns and from other sources that a quantity of tea included by us previously in our U. K. Shipment was actually in course of transhipment to America and Canada, also that a quantity of tea described previously as for China was actually intended for Western America. The figures have been adjusted as far as possible.
It should further be noted that for good reasons the Russian figures have been altered.
Out of the large quantity of the teas appearing as for China, the bulk eventually finds its way to Russia (in Europe and Asia) in the form of Brick Tea.

Supplement to this day's Issue.

1901–1902.

The Planters' Association of Ceylon,

KANDY.

FORTY-EIGHTH ANNUAL REPORT.

FOR THE YEAR ENDING 17TH FEBRUARY, 1902.

The forty-eighth Annual Report of the Planters' Association of Ceylon which your Committee presents to-day records a further period of work accomplished in the interests of the Planting Enterprise, and Agriculture generally. It reviews briefly the operations of your Committee and indicates some salient features while bringing various matters of a more general character under notice. The Register of Estates and Voters has been maintained, the total number being 918 at date, thus showing a large increase as compared with ten years ago when for the year ending 17th February, 1892, the Register stood at 647, while twenty years ago for the year ending 17th February, 1882, the Register was 561, and thirty years ago for the year ending 17th February, 1872, the Register showed 275 members only.

PLANTING PRODUCTS.

TEA.

Partly owing to finer plucking but chiefly on account of unfavourable climatic conditions the total shipments of tea for 1901 fell short of those for the previous year by 8,243,395. Outside markets however, took an increase of 5,019,599 lbs., leaving a total shortage of 8,262,794 lbs. sent to the United Kingdom. The amount available for consumption in Great Britain was further reduced by a large increase in Foreign Exports from London. Over the greater portion of the Planting Districts the weather was adverse to heavy flushing throughout the year and there was not experienced those heavy rushes which had become customary in late years. Rainfall was universally short and those Districts which are most dependent on an abundance of rain suffered most in yield. Judging from total shipments being only 3,243,395 behind last year, it would appear as if a large amount of young tea has come into bearing during the year. Your Committee feels that the possible maximum crop has by no means been reached, and would reiterate the importance of careful medium to fine plucking rather than the manufacture of large quantities of common quality Teas.

As of considerable interest for perusal, reference, and comparison from time to time, a few quotations from the leading London and Local Tea Circulars are herein placed on record with acknowledgments, and thanks to the compilers.

The packages printed for Public Sale in the past three years at London stood as follows:—

From 1st January to 31st Dec. 1901 ...	1,188,500 packages,	average 7d.	per lb.
Do. do. 1900 ...	1,263,200 do.	do.	7¼d. per lb.
Do. do. 1899 ...	1,108,800 do.	do.	7¾d. per lb.

In consequence of the inferiority of the 1900 crop, due to heavy flushes and coarse pluckings generally, prices at this time twelve months since (December, 1900) were at an abnormally low level for ordinary to fair kinds, clean Pekoe Souchongs selling at 4d. per lb., or 2d. per lb. under the quotation of the same period of the former year. Attention being thus forcibly directed to the situation a Committee was formed to deal with it, and although no uniform plan of action was adopted, the majority of Planters, by picking somewhat finer and using greater care in manufacture, contributed to produce a more saleable class, and also to curtail the output, so that values in the second half of the year showed some recovery, the average being:—

	1901.	1900.
Jan. to June	for 656,500 pkgs. 6¼d. per lb.	against for 655,400 pkgs. 7¼d. per lb.
July to Dec.	for 532,000 „ 7¼d. „	for 607,800 „ 7¼d. „

Owing to the measures taken, quality was considerably improved, and the Teas, especially common and medium descriptions, were better than for several previous seasons. On the other hand, perhaps, the selection of finest and choice growths was comparatively limited.

PRODUCTION.—Exports from India and Ceylon in 1900 totalled 384,000,000 lbs., while the world's consumption was only 314,000,000 lbs., resulting in a surplus of 20,000,000 lbs. In 1901 about 328,000,000 lbs. were exported from India and Ceylon, while the world's consumption was about 337,000,000 lbs.

Exports from India ...	lbs. 182000000	against lbs. 183000000	last year.
Exports from Ceylon ... „	146000000	„ 118000000	„
Total lbs.	328000000	331000000	

While the Consumption at home and abroad was about:—

India ...	... lbs. 184000000	against lbs. 172000000	last year.
Ceylon ...	... „ 153000000	„ 142000000	„
Total lbs.	337000000	314000000	
Surplus consumption lbs.	9000000	20000000	

The surplus is thus partially worked off. Exports from China have been considerably below last year's, which may further divert foreign demand towards British grown teas.

CONSUMPTION.—Home consumption appears to expand in spite of the higher duty, which has mainly been paid by Producers. Duty payments (estimating December) amount to 255,000,000 lbs. against 249,792,086 lbs. last year, and 242,560,818 in 1899. Abroad, some 13,000,000 lbs. more were used, the increase being to a large extent due to the unusually low prices. Progress has been remarkable, the quantity taken in 1890 being only 14,000,000 lbs., whereas in 1901 it was about 96,000,000 lbs. The opening of new outlets has practically saved the industry from ruin.

COARSE PLUCKING was mainly instrumental in reducing the lower grades to almost nominal values, and proved disastrous to many estates. Manuring, which was perhaps overdone in 1900, has not this year been so freely resorted to.

FROM COLOMBO REPORTS THE TOTAL EXPORTS FOR 1901 were 146,726,066 lbs. against 148,569,477 lbs. in 1900 distributed as under.

Tea distribution from 1st January to 31st December, 1901.

	United Kingdom.	Russia.	Other countries in Europe.	America.
1901	106,911,806 lbs.	9,198,801 lbs.	1,480,124 lbs.	3,654,105 lbs.
1900	114,229,642 „	8,959,781 „	1,319,667 „	4,112,208 „

	Africa and Mauritius.	Australia.	India.	China and *Singapore.	Total.
1901	412,225 lbs.	20,696,995 lbs.	1,108,913 lbs.	2,963,967 lbs.	146,726,066
1900	781,991 „	17,434,371 „	1,126,919 „	1,061,855 „	148,569,477

The following shew an increase over 1900:—Australia, Austria, Africa, China, Germany, Holland, Italy, Mauritius, Russia and Singapore, while America, Belgium, France, India, Malta, Spain, Sweden, Turkey and the United Kingdom shew a decrease. The figures for America, however, are somewhat misleading, as a considerable quantity of tea has been shipped there via London and China.

* This includes tea shipped to Hankow for manufacture into brick tea consumed in Russia and Siberia.

Ceylon showed an absence of the coarse Teas noticeable last year, and quality in consequence was better, and about equal to that of recent years. Average for Teas sold on garden account, 6·86d., against 7·20d. in 1900.

Green Tea—Some attempt has been made to capture the markets for Green Tea, especially in America.

Duty payments in 1901 indicate a normal increase in Home Consumption, the quantity consumed per head of population amounting to lbs. 6·17, against lbs. 6·11 in 1900, and lbs. 5·98 in 1899. The use of China Tea was extremely limited. Re-exports of Indian and Ceylon Tea showed a marked increase.

In Appendix C. will be found further Statistics relating to Ceylon Tea in London.

TEA BLIGHTS.

By far the greater portion of the Tea Districts have been wonderfully free from blights and pests of all description, and wherever cultivation has been carefully carried out grey blight has been practically absent. The most important during the year has been a serious attack of shot borer in one District, whilst the caterpillar of one or more of the Tortrices has given a good deal of trouble in another. The Government Mycologist is carrying out some interesting experiments in infection and the spreading of disease by isolating patches of tea in Hessian Tabernacles, and where caterpillar is bad it would be of interest to try the use of an acetyline light with a view to attack the pest when in the moth stage of its existence. The thanks of your Association are due to the Mycologist and the Entomologist, and also to the Director of the Royal Botanic Gardens at Peradeniya for readiness to assist with advice, when pests either new or old appear and give trouble.

TEA INDUSTRY AND OVERPRODUCTION.

During the year an effort was made, in conjunction with India, to curtail the excessive production of tea, and after various schemes had been considered it was decided to ask proprietors to reduce the estimated crop by 10% either by resting a portion of the acreage, finer plucking or by making the surplus into Green Tea. This scheme though approved of in India failed to receive a sufficient amount of support in Ceylon. Your Committee however feels that the attempt did a certain amount of good in that it accentuated the necessity for extremely careful plucking and manufacture. Your Committee would wish to herein recall the words of His Royal Highness The Duke of Cornwall when in Kandy recently: He said: "In 1882 the great tea cultivation was yet in its infancy and Ceylon planters were still engaged with one hand combatting the disease which threatened their staple, coffee, and with the other seeking for new products to replace or supplement it. To add to these difficulties came a serious financial crisis; but this combination of misfortune was faced with that intelligent resource and with that pluck, patience, and determination which have ever characterized the planters of Ceylon. It is owing to these qualities that your products have won the high position in the markets of the world."

INCREASE OF THE LEVY ENACTED TOWARDS INCREASING THE CONSUMPTION OF CEYLON TEA IN FOREIGN LANDS.

The following Minute and Resolution having been passed at a meeting of the "Thirty Committee" held on the 14th September, 1901, were submitted for the consideration of the Planters' Association of Ceylon:—Read Report of the Colombo Members of the "Thirty Committee", in conference with others interested in the American and Continental tea trade. After discussion the following Resolutions were passed:—(1) "That in the opinion of the Committee the cess should be increased. (2) That the Planters' Association be requested to ascertain the opinion of tea producers as to increasing the cess, with a view to give further assistance to the green tea industry."

Your Committee having considered the abovementioned Report and opinion, passed the following Resolution:—"That the Committee of the Planters' Association are convinced that an increase in the cess is a pressing necessity; (2) that the Ceylon Association be urged to join in the movement with a view to obtain the sanction of the Government to an increase of the cess from 20 to 30 cents per 100 lbs."

OFFICIAL ESTIMATE OF TEA CROP FOR 1901 AND 1902.

It having been decided not to make public an official estimate of the Tea Crop for 1901 in February, it was not until May that the Committee confirmed the original estimate of the Tea Crop for export during 1901 at 146,000,000 lbs. as follows:—

United Kingdom	...	105,000,000 lbs.
Australia ...	...	18,000,000 „
Russia ...	...	12,000,000 „
America ...	...	6,000,000 „
Other Countries...	...	3,000,000 „
Green Teas ...	...	2,000,000 „
		146,000,000 lbs.

Your Committee estimates the Tea Crop for Export during the year 1902, at 154,000,000 lbs. As regards the distribution of the Crop the following is submitted.—"Russia 11,000,000 lbs., Australia 21,500,000 lbs., America 6,500,000 lbs, other countries 7,000,000 lbs. leaving for the United Kingdom 108,000,000 lbs."

CACAO.

The crop for the past year, (1901), 47,471 cwts. is the largest on record, and as a careful examination of the increase of acreage does not lead to the conclusion that this is to any appreciable extent caused by new land coming into bearing, it may be assumed that the increase is due largely to the recovery of estates from the attacks of canker and other pests and that agriculturally cocoa is in a sounder position than it has been for some years. Forastero continues to supersede the red cocoa, and it is possible that it is due to this change in the character of cocoa exported that the market for Ceylon is in its present disorganized condition. The demand for the red cocoa of Ceylon was always of a limited description and the price depended on the sample being free from dark coloured beans. Very little Ceylon cocoa is now free from these, and as a result it has been hard of sale. At the same time Trinidad, which is all Forastero, sells readily at from 60/- to 70/-. It is probable that as the Forastero increases in Ceylon, that it will no longer command fancy prices, but will sell on a parity with good West Indian and with equal readiness. The statistical position of Cacao as a whole is sound, consumption is increasing, and the stocks are smaller than they have been for some years. Locally cacao stealing continues, and whilst acknowledging the efforts of officials to suppress this evil, it is now apparent that special legislation is necessary. Special outbreaks of crime are met with special legislation in all countries and the coffee stealing ordinance was passed to suppress such an evil in Ceylon. Some ordinance of the same description is now required to supress cocoa stealing. As the law at present stands, to obtain a conviction eye witnesses of the actual theft are a necessity, and many convictions therefore fail when there is no real doubt of guilt.

The following statistics are taken from Messrs. Wilson, Smithett & Co.'s London circular.

CARDAMOMS.

The area under this cultivation has been very largely increased during the past two years both here and in India. The exports for the year ending 31st December, 1901, show the heaviest on record, being 559,704 lbs. against 587,455 lbs. in 1900. Prices both in the London and local markets have fallen considerably in the past year in consequence of the heavy exports. With a still further large increase in acreage shortly coming into bearing from European estates and from native gardens recently planted in almost every village in the Kandyan Province the tendency must be to increase the exports to such an extent that the supply will probably exceed the demand and the market will likely fall below remunerative prices.

The following statement submitted by leading London Brokers shows the movements during the last twelve months as compared with the five previous years:—

		Years. 1901.	1900.	1899.

COCOANUTS.

The quantities of the different products of the cocoanut palm exported in 1901 show conclusively that, taking the island all over, there was no falling off in production, but rather a slight increase. Oil, Copra, Poonac, Desiccated nuts, all show an increase. The figures for oil and cocoanuts were the highest on record, save on two occasions; poonac has only once been higher, cocoanuts were exceeded by only about 150,000 last year; and the quantity of Desiccated Cocoanuts the largest ever exported. Coir rope and fibre were the largest for 8 years past (*for particulars see Chamber of Commerce Price Current Appendix*), so that the industry in all its branches may be said to have well maintained its position. It is difficult to say what has caused the recent great rise in the price of oil and especially of Copra; the rise in the price of nuts was greatest in the districts with cheapest access to the Metropolis, and in localities where there were desiccating Mills, which competed keenly with the Copra driers. Supplies, compared with other years, were not short, so outside influences must be sought for, and these were probably many. The war in the Philippines, restricting the export of Copra &c., reported decrease in the crop in the Straits Settlements; possibly a shortage in the export of palm oil from Africa; and, your Committee hopes, the discovery of new uses for the Cocoanut. Whatever the causes they contributed to raise the price of oil from Rs. 18 to Rs. 20 per cwt. and of Copra from Rs. 45 to Rs. 64 per Candy of 560 lbs., other products of the palm sharing more or less in the high prices. Such prices were never known before in the history of the industry, and till there is further information as to the real causes operating to produce them, it is not possible to say whether they may be expected to continue. The Cocoanut industry is at present on a very firm footing, and the acreage of new land planted of late is not such as to, in the near future, materially affect it. The trees continue free of any serious pest, the "Kuruminia", their worst enemy, being easily controlled. Altogether the outlook for owners of Cocoanut property seems bright.

RUBBER.

This product is receiving more attention; it is being steadily planted up both in the low country and also on estates situated at medium elevation. The yield and quality of rubber obtained from he Para variety growing in the Kalutara district has been very satisfactory, some of the rubber realising 4s. 2½d. a lb. Steps are being taken to import the seeds and plants of the best varieties of Castoloa into the Island.

TOTAL EXPORTS FROM CEYLON DURING THE YEAR 1901

Your Committee as usual invites attention to Appendix A. hereto annexed for official statements of Exports from Ceylon during 1901, for which your thanks are again due to the Hon'ble Mr. W. H. Jackson. The return is useful for reference and comparison with similar data made up to the same period by the Ceylon Chamber of Commerce, which follows as Appendix B.

RAILWAY EXTENSION AND IRRIGATION WORKS.

In view of the discussion that took place at the General Meeting of your Association on the 5th December, 1899, in considering the Secretary of State's Despatch No. 222 relating to the surplus balances of Revenue, attention is herein drawn to Sessional Paper XXXI, 1901, despatches relating to Expenditure on Railway Expenditure and Irrigation Works which will be included in the Book of Proceedings for future reference. With special reference to progress made in Railway Extensions the latest available authoritative information is the following from the Address of His Excellency the Governor on opening the present Session of the Legislative Council:—

"The Railways under construction are the Northern, the Kelani Valley, and that from Nanu-oya to Nuwara Eliya and onwards to the Hill Districts of Uda Pussellawa. The cost of these Railways is estimated at Rs. 11,029,376, Rs. 4,084,780, and Rs. 1,801,851, respectively. On the Northern Railway, which like the Uda Pussellawa Railway is under the charge of Mr. Oliver, the expenditure at the end of July amounted to Rs. 3,200,000. At both ends substantial progress has been made. On the first forty miles at the southern end the works are in hand, including nearly all the bridges and culverts on the first twenty miles. The rails are laid for ten miles, and there is a large quantity of bridge, permanent way, and other material on the ground. On forty miles of the northern end from Kankesanturai the work is well forward; the rails are laid for twenty miles, nearly to Chavakachcheri. At Anuradhapura also, on five miles on either side work is begun. Labour has been fairly plentiful. Work on the Uda Pussellawa Railway is in progress on the Crown lands through which the line runs, and the acquisition of the private lands required is now proceeding. On the Kelani Valley Railway (48½ miles) land has been acquired up to 45½ miles, and the earthwork has been completed up to 31 miles, and is being vigorously carried on between 31 and 43 miles. Of the major bridges, the masonry of three spans of 60 feet has been completed, and the masonry of three spans of 100 feet and of two spans of 60 feet is in progress. The Kirillapane bridge (which is to consist of one span of 100 feet and one span of 60 feet) and the Sitawaka bridge (which will consist of four spans of 75 feet) are advancing towards completion; the masonry of 185 bridges and culverts has been completed, and the masonry of 94 bridges and culverts is in progress."

By the courtesy of Government your Commiitee has been favoured with a copy of Report from the Chief Resident Engineer, Kelani Valley Railway, shewing the progress of the construction of the Kelani Valley Railway up to the end of December 1901—Maradana Junction to Yatiyantota, Length 48½ miles, Guage 2 feet 6 inches, and it may therefore be of interest to add that land for the Railway has been acquired up to 46 miles 11 chains, while the earth work in formation of banks and cuttings has been completed up to Avisawella Station (36 miles), and is in progress between 36 miles and 46 miles 11 chains. The Kirillapane Canal Bridge, the Bada Amuna Ela Bridge and the Maha Oya Bridge have been completed. The masonry of the Wak Oya Bridge has been completed, as also for the Heen Ela Bridge. The work in connection with other bridges is being pushed forward. In the forty-fifth Annual Report for the year ending 17th February 1899, your Committee placed on record an expression of the cordial thanks of the Planters' Association to His Excellency the Governor for the steps he had taken in the matter of the Kelani Valley Railway Extension, and in watching with keen interest the development of the policy of progress, it is matter of congratulation to know that His Majesty has been pleased to approve of the extension of His Excellency's term of office as Governor of Ceylon until October 1903, before which time it is certain the construction of the proposed Railway will have greatly advanced, thereby demonstrating that the period of the Governor's rule has witnessed progressive policy on wise and liberal lines.

CEYLON GOVERNMENT RAILWAY.

In connection with the Ceylon Government Railways your Committee welcomes the change in management and looks forward to early improvement and reform as so persistently asked for in the past.

INCIDENCE OF TAXATION.

Government having been unable to comply with your request for a reduction of Railway Rates, the appointment of a Commission on the incidence of taxation was asked for, and it is satisfactory to report that the Commission will ere long begin its labours.

GOVERNMENT CONTRIBUTION TO TEA FUND.

At the Annual General Meeting on the 17th February, 1901, a resolution was passed inviting Government to give practical effect to expressions of concern for the welfare of the Ceylon Tea enterprise in connection with the further exploitation of Ceylon Tea at various exhibitions by contributing to the Ceylon Tea (New Markets) Fund from general revenue during 1901, a sum equal to the amount collected during 1900 under Ordinance No. 4 of 1894 for increasing the consumption of Ceylon Tea in foreign lands. The application was formulated on the precedent of what has been termed the grant-in-aid system which has from time to time been applied in connection with planting and native interests with much benefit in other matters. The arguments adduced in support of the resolution were that owing to the serious fall in the price paid for Ceylon Tea the planting industry was in a critical position, a proportion of estates having been even worked at a loss, so that proprietors were not in a position to easily find the necessary further sums for required increased expenditure recommended by the "Thirty Committee." It is admitted that the prosperity of the industry and of Ceylon generally depends largely on increased demand for Ceylon Tea from foreign markets, and that it is desirable that the "Thirty Committee" should be placed in a position more extensively to make known Ceylon Tea throughout the world. The question was ably brought before the Legislative Council by your Representative there, but as he failed to receive that support which your Association fully expected the proposition was negatived.

LABOUR SUPPLY.

As usual your Committee appends abstracts of the Official Returns of arrivals and departures of coolies during the years 1899, 1900, 1901.

Months.		1899 Ar'vals	1899 D'tures	No. since the commencement of the year. Ar'vals	No. since the commencement of the year. D'tures

LABOUR FEDERATION OF CEYLON.

In connection with the Labour Federation the following Resolution was recently brought under the notice of your Committee at the instance of the Dimbulla Association:—"That this Association considers the present law regarding bolting coolies to be inadequate, and requests the Labour Federation Committee to consider the advisability of making the employment by any superintendent or cangany knowingly of a cooly who has not legally ceased to belong to another estate, an offence punishable by law."

A sub-Committee was appointed to consider the Resolution and to report generally on the present state of the Labour question.

CENSUS 1901.

According to Sessional Paper XXI, 1901: "The fourth decennial Census of Ceylon was taken on the night of 1st March 1901. The previous enumerations of which there is record were those of 1824, 1871, 1881 and 1891." The result is herein given for future guidance and reference. Your Committee and the Office bearers of District Associations co-operated all in their power as regards Estate Labours.

The Population of Ceylon at the Census of March 1, 1901, in the various Provinces, Districts, and Chief Headmen's Divisions of the Island, compared with the Population at the Censuses of 1881 and 1891 for the Local Areas of 1901.

Population excluding the Estates, Military, Shipping and Prisoners of War.					The Estate Population.

KEEPING OUT THE PLAGUE.

Your Committee would again, in continuation of the observations made in last Annual Report, congratulate the Planting Community and the whole Colony upon the fact that under Divine Providence Plague has for another year been kept from the Island. The thanks of the inhabitants are due to His Excellency, to the Plague Committee, and to the Port of Colombo Sanitary Officers for vigorous and effective action.

TATAPARAI DEPOT FOR COOLIES AND RAGAMA CAMP: SCHEME FOR REGISTRATION BROUGHT INTO OPERATION FROM OCTOBER 1st 1901.

It will be remembered that your Committee brought under notice in last Annual Report the proposed Scheme for the Registration of all estates employing Tamil labour by giving to each a distinguishing letter and number which would serve as an abbreviated and unmistakable address. The scheme has been satisfactorily launched and has received the cordial co-operation and support [illegible] devised with a view to facilitating Immigration and ameliorating the condition of the cooly. In reference to the tin ticket system it would be well not to lose sight of the initial reasons for the scheme. It was found that many coolies reached Tataparai without the necessary funds for maintenance in the depot whilst waiting for a kangany or for remittances from Ceylon and such coolies had to remain outside in a more or less impoverished state. The result was that the environment of the depot became insanitary with the risk at any time of an epidemic which the authorities might control with difficulty. Some alteration appeared to be advisable and necessary in the circumstances, but until some means were found to identify a particular cooly through the name of the estate to which he was proceeding, how the difficulty was to be overcome was not apparent, as it might become imperative to send back indigent coolies in large numbers from Tataparai to the villages from which the coolies had arrived. The new scheme provides a means of identification, and Government has approved and accepted it taking over the working of it in a liberal spirit. The risk of losing advances or coolies has not increased in any way, but the Planting Community will now, if desired by individual planters, know that when a cooly reaches Tataparai Depot coast advances and the coolies are as safe as if they were at a Railway Station in Ceylon. The scheme protects the cooly from blackmailing and extortion, so prevalent at Tataparai and Tuticorin. To ensure the success of the scheme it is essential that the Government Railway should issue cheap tickets to coolies only who have tin tickets under the scheme, though at the request of your Association Government has agreed to defer this restriction until the scheme has been in actual working for a period of three months, that is from 1st of April 1902. To recapitulate the use of the tin tickets is primarily because they afford a means of identification of the coolies returning from the coast at Tataparai. The tin tickets will probably prove advantageous to the Superintendents of Estates, because by having a consecutive number on the tickets it can be entered against the name of the recipient in a check roll, while each cooly going to the coast should have a tin ticket and a trustworthy cangany should have a certain number of tin tickets with him to issue to recruited labourers. One ticket will only pass one cooly. The cooly who receives the ticket or tickets becomes responsible for any claim against such tickets, but such claim would merely represent part of coast advances to the cooly. Your Committee does not anticipate trouble or loss from forgery, but the matter is one that can only be tested by experience. Any cooly having a tin ticket—forged or otherwise—will be delivered at the nearest Railway Station to the estate referred to. In most cases the cooly can be met, and in the majority of other cases he comes over again with a responsible cangany who will see him on to the estate or who would issue to him an estate tin ticket. There appears to be no sufficient inducement for forgery, as a *bona fide* estate labourer would always be able to secure one, whereas the cooly desiring one for other purposes would hardly secure a forged ticket only to find himself delivered at a Railway Station many miles from his intended destination.

In appendix **D**. will be found the latest information and regulations with reference to the working of the scheme.

POST AND TELEGRAPH.

DISTRICT LETTERS.

On representations made by the Dimbula Association the Postmaster-General was addressed regarding the advisability of admitting as District letters ordinary covers bearing a 2 cent stamp, and it is satisfactory now to be able to report that the necessary authority to admit at the 2 cent per ounce rate District Letters enclosed in covers of the approved kind and bearing adhesive stamp was obtained. The various firms selling stationery can now stock the envelope of the prescribed colour and lettering in different qualities to suit purchasers. This desired improvement will doubtless be found both useful and economical.

PROVINCIAL AND DISTRICT ROAD COMMITTEES.

In connection with the proceedings of the Provincial and District Road Committees, Central Province, during the past year, printed lists of the Minor Roads in the districts have been tabulated and will doubtless be found useful, as also similar information in reference to the Resthouses open or otherwise available for the use of travellers. Your Committee has further endeavoured to obtain through the various District Associations a return of grant-in-aid roads, as the opinion is held by many that the time has come when most of these roads should by arrangement be taken over by Government. Your Committee would avail of the opportunity to place on record here one or two of the recommendations made in the report of the Public Works Commission (Sessional Papers XXXIII—1901) in reference to Roads and which His Excellency the Governor having been pleased to accept, have been conveyed to the Director of Public Works as instructions on the order of the Governor: "Instructions will be issued to Government Agents to obtain from headmen periodical reports as to the condition of the roads in their districts and these will be duly communicated to you." "The important proposal made in paragraph 25 as to the amendment of the law so as to admit of the application of section 8 of the Branch Roads Ordinance to estate roads and also to admit of Government contributing out of public revenue towards the cost of construction and maintenance of certain roads, has also been accepted and will be proposed to the Legislative Council. If this compromise proves to be inadequate Government will be prepared to consider the recommendation of the Hon'ble Mr. Campbell [illegible] the provisions of Ordinance No. 14 of 1896 to all [illegible] of the Local Committee." "The [illegible] the Public Works Department the road work [illegible] under the control of the District Road Committees has not been [illegible]. His Excellency would on the contrary like to see the sphere of the local bodies enlarged and their efficiency and usefulness increased. The result of the opposite policy would be a largely increased expenditure without any corresponding benefit to the community. Much good and useful work as his journeys throughout the Island have shown him, is now cheaply and efficiently done under the supervision of these local bodies, whose interest it is to ensure economy." It is understood that an Ordinance is being drafted to give effect to the above recommendations. The proposal to take over the Grant-in-aid Roads will be referred, it is anticipated, to the Commission on the incidence of Taxation.

In Appendix **E** will be found interesting statements of the commutation money spent on the Principal and Minor Roads in the Planting Districts for a number of years.

REDUCTION OF BRITISH TEA DUTY.

In addition to the representation of your Association forwarded through Government to the Secretary of State for the Colonies urging a reduction, at as early a date as is compatible with the financial needs of the Empire of the Import Duty on Tea in Great Britain, His Excellency the Governor also telegraphed that the Ceylon Government desired to impress on His Majesty's Government the disastrous consequences which a further increase of duty on tea might entail on the chief industry of this loyal Colony. A reply was duly received that the Governor's despatch and telegram had been laid before the Chancello rof the Exchequer, while later on it was announced that though the duty would not be reduced at present it would not be increased meanwhile. Your Committee would again record the gratitude of the Association for the action taken by His Excellency in the matter.

CUSTOMS DUTY UPON COLONIAL PRODUCE ENTERING FRANCE FROM COUNTRIES WHICH DO NOT ENJOY MOST FAVOURED NATION TREATMENT.

At the close of last year the Ceylon Association in London was asked to watch the further developments in the matter of the proposed increased Customs Duty upon Colonial Produce entering France from countries which do not enjoy Most Favoured Nation Treatment with a view to any further action. In conjunction with the Ceylon Chamber of Commerce a second memorial to the Secretary of State was forwarded in September, 1901, again drawing attention to the law passed by the French Government on 24th February, 1900, that altered Customs Duty upon Colonial Produce entering France from countries which do not enjoy Most Favoured Nation Treatment, pointing out the serious effect which the final passing of such a law would have upon British Colonial Products and particularly upon Tea, Coffee, Chocolate and Spices exported from India, Ceylon, the British West Indies, and the British East and West Coast of Africa. The prayer of the memorial had in view the securing a postponement of the new duties, at all events to the extreme limit allowed by article 6 of the law so as to avert if possible should the British Government be unsuccessful in obtaining for its Colonies Most Favoured Nation Treatment an exceedingly severe blow to British Colonial trade with France. Your Committee is glad to learn that the French Law referred to of 24th February, 1900, will again be suspended for a year, so that the duties during that time will remain as they now are and there will be no increase of the present duties on Ceylon Tea.

DUTY ON TEA IN AUSTRALIA.

It will be in the recollection of members that a proposal was made to levy a duty of 2d. per lb. plus 20 per cent *ad valorem* Duty on Tea within the Commonwealth of Australia and that prompt action was taken in the matter both by His Excellency the Governor and the Ceylon Chamber of Commerce to insure reconsideration. The thanks of your Association are herein rendered and the following resolution was transmitted to the Chamber:—

"That the Committee of the Planters' Association cordially approves of the action taken by the Chamber of Commerce in approaching the Federal Parliament of Australia with a view to re-adjustment of the duty proposed on tea, and endorses the arguments brought forward by that body that the imposition of an *ad valorem* duty is seriously detrimental to the interests of capital employed in the tea industry of Ceylon and India, placing as it does a premium upon cheap China teas." In the result the composite duty on Tea was abolished in favor of a fixed duty on Tea of 8d. per lb. bulk and 4d. per lb. packets.

RUBBER PLANTING IN BURMAH.

Your Committee having received information that the Government of India was taking steps to develop the cultivation on a large scale of Rubber producing trees in Burmah, notably the Para Rubber Tree Hevea brasiliensis, Mull, Arg, in the Tenaserim division of Burmah, resolved to bring the question under the consideration of His Majesty's Government. In a memorial to the Secretary of State on the subject it was pointed out (I) that an authoritative statement that the Government of India had no intention of placing Rubber on the London market nor competing with private enterprise by large operations would tend to remove any cause for alarm, and (II) that there appeared to be no necessity for an extensive experimental cultivation of five thousand acres because the successful planting of Para Rubber in suitable climates is already assured. Your Committee regrets to report that the reply received must be considered distinctly disappointing in as much as it exhibits a want of sympathy with the legitimate claims of private enterpriee to due consideration and an assurance as desiderated.

PERIODICAL TOURS OF SCIENTIFIC OFFICERS, AND CONNECTED MATTERS.

Your Committee has pleasure in again bringing under notice the periodical tours of scientific officers of the staff at the Royal Botanical Gardens, Peradeniya, and to the interesting papers read at various District Association meetings during the year as well as to the discussions that took place. The idea continues to recommend itself as a happy one which it is hoped will continue to expand, thus bringing scientific research and practical working in agricultural operations into yet closer touch with the best results.

ANALYSIS OF MANURE.

ORDINANCE NO. 12 OF 1901. AN ORDINANCE FOR REGULATING THE SALE OF MANURES OR FERTILIZERS OF THE SOIL.

Your Committee is glad to be able to direct attention to the Ordinance above mentioned which may be cited as the Fertilizers' Ordinance 1901 which came into operation on the 1st of January, 1902. The regulations under section 9 of the Ordinance made by the Governor with the advice of the Executive Council were published for general information in the "Ceylon Government Gazette" No. 5816 of November 8th, 1901, and copies were circulated to the various District Associations. They relate chiefly to the proceedings and regulations with general directions as regards samples of the fertilizers. Your Committee has lately, on the invitation of His Excellency, submitted for approval the name of Mr. Kelway Bamber as analyst under section 5 of the *Ordinance No. 12 of 1901*.

VISITORS TO HOSPITALS AND *DISPENSARIES* IN THE PLANTING *DISTRICTS*.

Without anything special *to mention your Committee is glad* to know that these appointments continue to prove useful and beneficial. Quoting from His Excellency's address on opening the session of the Legislative Council for 1901, your Committee records with satisfaction the following sentence:—"Many necessary additions have been made during the year to dispensaries and hospitals, and it is expected that the new hospitals for Maturata, Passellawa and Dimbula and the Infectious Diseases Hospital at Nuwara Eliya will be finished by the end of the year."

PLANTERS' WARD AT THE GENERAL HOSPITAL, COLOMBO, AND AT THE BAKER WARD, NUWARA ELIYA.

Your Committee would convey an expression of thanks to the Principal Civil Medical Officer and through him to those immediately in charge of the wards, for the attention and care bestowed upon Planters in these wards during the past year. The following is the Official Return of Planters who availed of the Planters' Ward, Colombo, and the Baker Ward, Nuwara Eliya, during the year 1901:—

Hospitals.	Number remained on 31st Dec., 1900.	No. admitted during 1901.	Total.	No. discharged.	Died.	No. remaining on 31st Dec., 1901.
Planters' Ward, Colombo ...	4	43	47	42	2	3
Baker Ward, Nuwara Eliya ...	1	2	3	2	1	—
Total ...	5	45	50	44	3	3

PUBLIC WORKS.

In the annual report of your Committee for the year ending 17th February 1901 reference was made under this head to the cost of the new policy with included the Northern, Uda Passellawa and Kelani Valley Railways, and Irrigation Scheme, the whole estimated cost amounting to Rs. 20,640,000, half of which was to be provided by loan and half from the surplus Revenue of past and future years, and it was shown that at that time, exclusive of the Irrigation vote of Rs. 200,000 per annum, a sum of Rs 2,400,000 remained to be provided out of revenue. This sum has now been provided, as the following quotation from His Excellency the Governor's address to the Legislative Council at the opening of the Session of 1901/02 on the 18th October, 1901, will show:—"Last year I drew attention to the large liabilities which we had incurred on account of the very extensive scheme of Railway and Irrigation Extension sanctioned by the Secretary of State, of which the cost was estimated at Rs. 20,640,000. Of this amount, one-half was to be met from borrowed money and one-half from past and future savings from General Revenue. I then expressed the hope that the whole of this liability—I mean the sum of Rs. 10,320,000 to be found out of revenue—would be discharged in 1902 or perhaps 1903. My anticipation has been more than realised, for the correspondence with the Secretary of State, which will be submitted to you, will show that the balance can be met out of the surplus for 1900, and accordingly that the liability is fully discharged. You are now free from debt on this account and the surplus of this and succeeding years will again be at your disposal. I congratulate you on this happy issue of a vexatious controversy. It dissipates many gloomy anticipations and justifies the views and arguments with which I commended to you this great policy of progress." During the year the Commission on the cost of Public Works continued its sittings and its report has been published as sessional paper No. XXXIII, 1901. A good deal of valuable information is embodied in the report and several important recommendations have been made, most of which have met with the Governor's approval, and will be acted on. One important recommendation was that the grant-in-aid principle should be extended to a cheaper class of roads than had been permitted under the old ordinance, and it is understood that an ordinance to carry out this recommendation is now under consideration. The subject of the taking over of grant-in-aid roads as main roads has not been lost sight of, but as it is to be referred for the consideration of the Commission on the Incidence of Taxation nothing further can be done until that Commission commences its sittings. The expenditure on Public Works extraordinary was considerably cut down when it became apparent that the revenue of 1901 was likely to show a falling off, and by the omission of certain works not of a very urgent nature only about Rs. 1,476,000 will have been spent out of the estimated Expinditure of Rs. 1,950,120. For the new year the estimate of expenditure on Public Works extraordinary is Rs. 1,847,072, and on annually recurrent works Rs. 2,044,815. This is exclusive of the expenditure by the Irrigation Department which is now in full swing and has an estimated expenditure of Rs. 1,240,137 principally chargeable to surplus funds.

REDUCTION OF TELEGRAM CHARGES BETWEEN THE UNITED KINGDOM AND THE EAST.

In continuation of the paragraph in last year's Report it is interesting to note that a reduction is now definitely spoken of from 4s. 2d. to 2s. 6d. per word on cable rates to the East and that effect may shortly be given to this new departure in the right direction.

CEYLON PLANTERS' RIFLE CORPS.

Adverting to the paragraph in last Annual Report recording the establishment of a Rifle Corps your Committee congratulates all concerned on the progress since made and places as appendix **F** hereto for perusal and reference the latest authoritative information regarding the corps as to regimental organization and equipment.

CEYLON CONTINGENT OF MOUNTED INFANTRY.

It will be remembered that His Excellency the Governor remarked in addressing the Legislative Council: "From our small European population we raised a contingent of 130 young men, well mounted and fully equipped, to represent the Crown Colonies among the armed levies which the self-governing Colonies were despatching to the seat of war. Our contingent—too few in numbers—has been cruelly decimated by disease, but those who remain have been in the forefront of the fighting and we have the testimony of the Commander-in-Chief, spontaneously offered, that they have rendered excellent service."

In addition to and in continuation of other references in previous Annual Reports your Committee has the honour to record that during the Royal visit to Kandy in April, 1901, His Royal Highness the Duke of Cornwall presented the King's Colour now domiciled in the Victoria Commemoration Buildings to the Officer Commanding the Ceylon Mounted Infantry and distributed Medals to the Members of the Ceylon Contingent who had returned to the Island. The words of the Prince were: "A very pleasant duty has been deputed to me by the King. It is to present His Majesty's Colour to the Ceylon Mounted Infantry and to confer the South African War Medal upon those of the Regiment who have taken part in that campaign. I confide to your keeping this Colour, not only as a record of past services but as an emblem of loyalty and patriotism, round which you may rally whenever the occasion shall arise to again give your services to the defence of the interests of the Empire. I regret that as hostilities yet continue, many of your comrades cannot be present here to-day. There are some who, alas, can only be here in memory. We heartily sympathise with all who mourn for dear ones such as Lieut. Thomas, one of three brothers belonging to an old and respected planter family, and others who laid down their lives or sacrificed their health in following the call of duty. I take the opportunity of acknowledging the valuable services rendered by the planters. They not only sent a large number of Volunteers to the Front but formed themselves into a Rifle Corps, which I am glad to say is represented here today, for the protection of your own shores against a possible foe."

It has further been resolved that a permanent monument be erected in commemoration of the Ceylon Contingent on the Victoria Garden adjoining the Victoria Commemoration Buildings, Kandy.

CEYLON ASSOCIATION IN LONDON.

During the year the action of the Ceylon Association in London in correspondence with your Association has been alike practical and beneficial. Your Committee rests assured that cordial co-operation and a good understanding will always be maintained if possible on both sides and that in this as in other matters conspicuous regard will be rendered *to the motto* "Unitas Salus Nostra" in the interests of all in any way connected with the great Agricultural enterprise of *Ceylon*.

REPRESENTATIVE IN *THE* LEGISLATIVE COUNCIL.

To the Hon. Mr. J. N. Campbell an expression of the *cordial thanks of your Association* is again conveyed *for his watchful* and *greatly appreciated service* as Planting Representative in the *Legislative Council during* the past year.

DISTRICT ASSOCIATIONS.

There are now, your Committee is glad to report, twenty-six District Associations as compared with ten District Associations during the year ending 17th February, 1892. In no mere form of words an expression of thanks is herein tendered to the Office-bearers for willing co-operation and courteous attention to the various demands made during the year in connection with planting and connected matters.

BAKER MEMORIAL.

In the Annual Report for the years ending 17th February, 1897 and 1898 respectively, reference was made to the munificent gift by the late Mrs. Baker of the Planters' Ward at Nuwara Eliya and to the proposed Window in Holy Trinity College, Nuwara Eliya, to perpetuate her memory, it is satisfactory therefore at length to be able to report that the work has now been completed. The three lights in the East Window of the Church representing the Annunciation, the visit of the wise men and the raising of Jairus' daughter are those on which the subscribers' money has been expended amounting to Rs. 1,503·65 inclusive of Erection and also the Enlarged Photograph of Mrs. Baker placed in the Victoria Commemoration Buildings, Kandy.

PLANTERS' BENEVOLENT FUND.

ESTABLISHED TO COMMEMORATE THE JUBILEE OF HER MAJESTY QUEEN VICTORIA 1837—1887.

Though the aggregate of Donations and subscriptions collected by the Honorary Treasurer of the Fund during the year 1901 is less than usual, amounting to Rs. 112·87 and Rs. 2640·00 respectively, this is largely accounted for by those who are "Patrons" under regulation **D** having accordingly ceased to subscribe annually and by the removal or decease of old subscribers, while Donations naturally are more or less exceptional and can hardly be looked upon as a steady factor in calculating annual revenue. During the year 1900 a considerable sum was collected as arrears of subscriptions for previous years which thus increased the total for that period of twelve months. When these incidents and adjustments are looked into it appears that the position of the fund has been maintained notwithstanding the fact that in view of the times and the many demands made on planters no special effect was given to the general recommendation of the subscribers, that an application be sent direct to the members of the Planters' Association of Ceylon on a form to be drawn up. The disbursements from the "Fund" in the form of grants to those in need of assistance have aggregated Rs. 1926·18 during 1901 while the interest on investments amounted to Rs. 1829·39. Indian Government 3½ per cent paper was purchased during the year to the value of Rs. 3,000·00, other investments remaining as before. Your Committee would again cordially commend the Planters' Benevolent Fund to all Planters and would invite every one either by annual subscription or donation to co-operate in building up the Fund so as to permit of its beneficent action being kept up and extended in the future.

VISIT OF THEIR ROYAL HIGHNESSES THE DUKE AND DUCHESS OF CORNWALL AND YORK IN APRIL, 1901.

An event unique in the History of Ceylon—and not Ceylon alone but also His Majesty's Dominions beyond the seas—has to be recorded in the auspicious and ever welcome visit of Their Royal Highnesses the Duke and Duchess of Cornwall and York, now Prince and Princess of Wales. It will be remembered that Their Royal Highnesses broke their journey and visited Kandy en-route, as the Prince said, "To preside at the first representative assembly of the Australian Commonwealth," and there can be little doubt, as has been well remarked, that one result of the Prince's journey will be to systematise and make more businesslike the bonds uniting the Empire. An Address of Welcome on behalf of your Association was presented to His Royal Highness at the King's Pavilion, Kandy, on the 18th April to which the Duke graciously replied. The Address was placed in a beautiful Casket of Ivory set with Ceylon gems of value, and it is hoped may be regarded as a Memento of the visit to Ceylon by the Prince and Princess in years to come. From the Duke's eloquent words then spoken the following might be engraven as alike of admonition, encouragement, and aspiration: "I feel sure you are fully alive to the necessity in these days of keen competition of maintaining the same high standard of skill and energy for keeping and extending the position you have secured. I much regret that at the present time your prospects are not so bright as usual. I earnestly trust that this depression is but temporary; and I shall watch with interest for an early revival of prosperity, which you so well deserve. I thank you for the language in which you refer to the important mission with which I have been entrusted by my dear father, and for your wishes that it may serve to knit even closer the ties of affection which bind together the Empire over which His Majesty rules. I shall not fail to convey to him your expressions of loyalty and attachment to his throne and person, and of your reverence for the memory of our late beloved and universally mourned Sovereign."

GEORGE WALL REFERENCE LIBRARY AND TOWER.

The thanks of your Association is herein recorded to Government, kindred Institutions and other donors for valued contributions to the Reference Library in the past year. It will be remembered how small was the beginning made twenty years ago as mentioned in the Annual Report for the year ending 17th February 1882 in the direction of a more convenient arrangement of a few books then belonging to the Association and a more comfortable Reference Reading Room, for publications, Reports and Newspapers. Your Committee is glad to again report progress and that the Collection now styled "The George Wall Reference Library and Tower," is firmly established and is likely to increase in usefulness, interest and importance hereafter.

OBITUARY.

To the Roll of deceased Members of the Planting Community has to be added with much regret the following:—W. Beattie; C. C. Bell; Alexander T. Brown; John Cameron; Wm. D. Evans; P. O. B. Horsford; Wm Keith; H. P. Marshall; T. J. Martin; A. Orchard; T. N. Orchard; A. A. Pillans; J. M. Smith; L. C. White; W. Boyd; A. H. Hopkinson; F. D. Lloyd; Fred. Pulley; H. P. Shakerley; John Stuart; A. H. Bisset; J. B. S. D'Aguilar; Stanley Ross; C. Campion; Jas. G. Macfarlane; Norman Smellie; E. Kensington; Geo. S. Duff; H. B. Carrick; Wm. Robb; J. Hodgson; W. Sandys Thomas; W. J. S. Scott; P. B. Whittaker, E. Kensington.

FINANCES.

In laying on the table the Accounts of your Association for the year made up to 31st January, 1902, it is satisfactory to state that the balance remaining at credit is Rs. 5,186·20.

The record of the year has been one of investigation, development and progress. Interest in the work of the Planters' Association of Ceylon continues to increase, while the value of its organisation to producers has been again apparent and it is believed appreciated. It is certain that in the future the extended usefulness of the operations of your Association will be further demonstrated, and your Committee in resigning office would urge on Proprietors and all interested in the agricultural prosperity of Ceylon the importance of prominent and practical support with cordial consideration at all times to proposals submitted having in view the advancement and continued prosperity on the great planting enterprise.

APPENDIX A.

General Export from the Island of Ceylon in the year 1901.

H. M. Customs,
Colombo, 20th January, 1902.

W. H. JACKSON,
Principal Collector.

REPORT OF THE THIRTY COMMITTEE.

Report of the "Thirty Committee" appointed to administer the proceeds of the Export Duty on Tea, levied under Ordinance No. 4 of 1894 for increasing the consumption of Ceylon Tea in foreign lands for the year 1901.

Members of the "Thirty Committee," 1901.

The following is the list of the "Thirty Committee" at 31st December, 1901.

Messrs. James Westland, J. A. Burmester, A. C. Kingsford, J. B. Coles, Hon. Mr. J. N. Campbell, Geo. Kent Deaker, Alex. Wardrop, Wm. Saunders, R. A. Galton, H. O. Hoseason, Gordon Pyper, W. D. Bosanquet, T. C. Huxley, Wm. Forsythe, A. Philip, J. P. E. Ryan, Joseph Fraser, W. R. Tatham, E. D. Harrison, R. S. Duff Tytler, W. D. Gibbon, Edward Rosling, Oliver Collett, Keith Rollo, Geo. Hathorn, G. F. Traill, R. S. Templer, Hon. Mr. W. Henry Figg, Duncan Skrine, Stanley Bois.

For part of the year Messrs. H. A. Tipple and E. H. Hutchinson were members.

Finances.

The total collections paid into the Ceylon Tea (New Markets) Fund on account of the Export Duty on Tea from January 1901 to 31st December 1901 amountd to Rs. 292,542·29. The balance in the Bank brought forward from 1900 was Rs. 82,009·98.

The usual summary of accounts for the half-yearly periods ending 30th June 1901, and 31st December 1901, with various connected statements of Charges and Discharges are appended.

Minutes of Proceedings.

The Minutes of Proceedings of the Meetings of the "Thirty Committee" have been as usual forwarded to Government for information and guidance after confirmation.

Governor in Executive Council.

The approval of the Governor in Executive Council was obtained to the following appropriations of the proceeds of the levy as from time to time desired and determined by the "Thirty Committee" during the year.

Credit opened for—

1.—Representative in America. Amount appropriated and sanctioned by the Governor in Executive Council per letter dated 9th February 1901, for advertising Ceylon tea in America during 1901, £8,000 sterling at exchange 1/4 per rupee ... ... Rs. 120,000·00

2.—Ceylon tea on the Continent of Europe. Amount appropriated and sanctioned by the Governor *per letter dated 9th* February, 1901, for advertising Ceylon tea on the Continent of Europe during 1901, £8,000 sterling at exchange 1/4 per rupee ... ... ,, 120,000·00

3.—Ceylon Green Teas 1900-1901 scheme. Amount appropriated and sanctioned by the Governor in Executive Council per letter dated 10th January, 1901, for the purpose of payments under the scheme ... ... ,, 20,000·00

Amount appropriated and sanctioned by the Governor in Executive Council per letter dated 18th February, 1901, for the purpose of payments under the scheme ... ... ,, 30,000·00

December 23rd	do.	do.		1,000	15,000·00
				Rs.	262,561·37

Up to 31st December, 1899, the amount remitted to Mr. Wm. Mackenzie for pushing, advertising and making known Ceylon tea in America aggregated Rs. 811,862·11, making a grand total of Rs. 1,081,862·11 placed at the disposal of the Representative in America from 1894 onwards. As regards the results of the Campaign opinions may doubtless differ, but as affording useful data in the matter the following is quoted from recent remarks of leading London brokers under date 29th November, 1901.

There has been considerable progress in the quantity of Indian and Ceylon tea taken in North America during the last nine months, as compared with the same period of 1900, the increase amounting to nearly 40%. Re-exports from this country have also materially increased.

It is noteworthy that 1,276,868 lbs. of *all* tea were sent from America to this country between 1st January and 27th November, but there is reason to believe that much of this was China tea, while a portion of the tea sent from Ceylon to China may possibly have been for the Russian Market, although the majority has doubtless gone to America.

* Possibly some portion of this quantity may have gone to Russia, in which case this figure will be too large.

As reporting generally on the position of matters Mr. Mackenzie writes :—

"I send a few remarks on our work in America in 1901. Owing to the reduction in the amount allowed me for 1901, the work had to be curtailed somewhat. The system was the same as during former years—that is, Press advertising with assistance to whose who advertised our teas, sampled, demonstrated, sent out circulars, &c.

A larger portion of our general advertising was done in Canada this last year as several packet firms there were pushing Ceylon Greens. It is too soon yet to know the total shipments of Ceylon teas to America during last year, but up to end of September they appear to have been about 10 per cent. ahead of previous year. To me, this is a pleasant surprise, as owing to the large import of cheap China Congous (black teas) in 1900-01 there seemed to be less room for Ceylons. It looks a decided sign of progress. The imports of Congous in 1901-02 are expected to be only half of the quantity during 1900-91. But dealing with figures giving forward estimates is dangerous, as circumstances may arise which entirely upset prophesies. As Ceylon has for the present almost entirely ceased to help the sale of its black teas in America, I may be expected to say something of the chances of Greens, for which the field is much larger. I have had so many good reports of the quality of the Greens hitherto sent to America and have known so many instances where Firms have purchased those teas five to ten times, that I cannot for a moment doubt that our Greens *suit the people* when they *have had a fair chance of trying them.* Several others—experts—representatives of Colombo Firms, who have travelled in America, with the express purpose of ascertaining the feeling there regarding our "Greens," have been so convinced as I have been.

In the cup the teas are liked, although the difference from Japan teas in appearance is occasionally made an objection. And it undoubtedly is, because the Grocer does not care to risk handling a tea so unlike what his customers have always drunk. While he is trying to induce them to buy the new article, his rival across the Street has sold them the old one. This objection may be overcome, as an attempt is to be made in Colombo to manufacture and pack the tea to resemble Japans. The real obstacles are the vested interests and large establishments in China and Japan of the few large Importers, who practically own the entire Tea market of America. They cannot reasonably be expected readily, or without a severe struggle, to abandon their capital and business in the far East, and allow the trade to go to Colombo. In Canada it appears to me lies our line of least resistance with the Greens, and, during this year, our work should be chiefly done there. The sum available is too small to touch the Green Tea portion of the United States, which extends from Buffalo to the Western Coast. The most enthusiastic advocate of Green Ceylon Tea is still the man who has handled most of Mr. Larkin of Toronto, Canada."

From a Statistical point of view the following figures are appended :—

American Imports of Tea.

Year ending June 30.		Net imports. Pounds.	Value. Dollars.	Av. import price ₱ lb. Cents.	Per capital consumption Pounds.
1882	...	77,191,060	18,975,046	24·6	1·47

CEYLON GREEN TEAS.

In terms of resolution passed by the "Thirty Committee" the following memos showing payments made under Ceylon Green Teas Grant have been from time to time prepared and will be useful for perusal and reference, also including amount from previous statements in the Report for 1900.

Appended thereto will also be found extracts of all the various minutes passed by the "Thirty Committee" since 1896 onwards in connection with the Green Teas for the United States of America and also a specimen of one of the latest general advertisements of Black or Green Ceylon Teas regularly published in the Canadian *Grocer.*

(Specimen of General Advertisement referred to.)

Black or Green Ceylon Tea.

The merit of the Black Teas has established them high in popular estimation. They are drunk wherever the English Language is spoken. They follow the flag and drive out less meritorious growths.

But some consumers are wedded to light drawing kinds, with pale liquor and without the full body and richness of the black kinds.

The Green Teas of Ceylon are made expressly for this trade. In Make, Quality and Price they challenge comparison with other growths.

They are grown, prepared and packed with the same skill by the British Planters who have revolutionized the Black Tea Trade.

They have caught on in Canada and are no longer in the experimental stage.

☞ TRY THEM.

As regards the American Market, the extract appended from a trade journal is of interest :—

New York, January 8th.

"Invoice trading light; jobbing demand slow. Prices are well sustained, especially for greens.

REVIEW FOR 1901.

The year 1901 opened with 54,881,219 pounds of tea in Warehouse, which quantity steadily declined to 39,521,551 pounds on November 30th, 1901.

The following table shows the quantity of tea entered for consumption in the United States, including both entries for immediate consumption and withdrawals from warehouse for consumption, value and amount of duties, for the twelve months ending June 30th, 1900 and 1901 :

	Quantity. Pounds.	Value. Dollars.	Duties. Dollars.
1900 ...	80,086,369	10,835,048	8,008,637
1901 ...	82,598,537	10,005,430	8,259,354

The imports for eleven months of 1901, ending November 30th, were as follows :—

		Pounds.
Chinese Empire	... ...	25,692,503
Japan ...	... ...	28,159,849
All other countries	... ...	6,798,104
	Total ...	60,650,456
Same time in 1900	... ...	89,456,696
Same time in 1899	... ...	77,517,386

The above shows that Japan supplied 46 per cent. and China 42·6 per cent. of the total imports.

The light receipts and a slight increase (8 per cent. plus) in consumption accounts for a steadily improving market during the year. The close was firm at the best figures.

Ceylon Tea on the Continent of Europe.

The Remittances and Disbursements on account to Mr. J. H. Renton from 13th February, 1900, made in Ceylon for pushing and making known Ceylon Tea on the Continent of Europe to 31st January, 1901, have been as follows :—
